Informatics Forum – AV Guide

There is no physical access to the DICE machine, 2 USB ports are provided on the cabinet to connect devices to it.

1. Press the ON button, it will blink for several seconds. PLEASE WAIT, this delay is to preserve the projector lamp.

2. After it stops blinking, select your input. The default is MAIN PC, this is a DICE machine stored within the cabinet (not installed in Ground floor cabinets). PC1 selects input from the laptop audio and video connections on the cabinet. PC2 is for those on the meeting table. AUX is currently non-functional.

The Volume Up/ Down buttons control the overhead speakers, obviously this requires your input device to not be on mute!

3. When you use the OFF button, it will blink and take several seconds to shutdown. This allows the lamp to cool down. Therefore if you have multiple presentations or wish to do something private on your machine it is advisable that you switch input instead of switching off and on the projection unit.
