ADS (2018/19) – Lecture 4 – slide 1

The Master Theorem for solving recurrences

Algorithms and Data Structures

Strassen's Algorithm

Theorem

Let $n_0 \in \mathbb{N}$, $k \in \mathbb{N}_0$ and $a, b \in \mathbb{R}$ with a > 0 and b > 1, and let $T : \mathbb{N} \to \mathbb{R}$ satisfy the following recurrence:

$$T(n) = \begin{cases} \Theta(1) & \text{if } n < n_0, \\ a \cdot T(n/b) + \Theta(n^k) & \text{if } n \ge n_0. \end{cases}$$

Let $c = \log_b(a)$; we call c the critical exponent. Then

$$T(n) = \begin{cases} \Theta(n^c) & \text{if } k < c \qquad (I), \\ \Theta(n^c \cdot \lg(n)) & \text{if } k = c \qquad (II), \\ \Theta(n^k) & \text{if } k > c \qquad (III). \end{cases}$$

Theorem also holds if we replace $a \cdot T(n/b)$ above by $a_1 \cdot T(\lfloor n/b \rfloor) + a_2 \cdot T(\lceil n/b \rceil)$ for any $a_1, a_2 \ge 0$ with $a_1 + a_2 = a$.

ADS (2018/19) – Lecture 4 – slide 2

The Master Theorem (cont'd)

We don't have time to prove the Master Theorem in class. You can find the proof in Section 4.6 of [CLRS]. Section 4.4 of [CLRS], 2nd ed.

Their version of the M.T. is a bit more general than ours.

Consider the following examples:

$$T(n) = 4T(n/2) + n,$$

$$T(n) = 4T(\lfloor n/2 \rfloor) + n^{2},$$

$$T(n) = 4T(n/2) + n^{3}.$$

Could alternatively unfold-and-sum to prove the first and third of these (and to get an estimate for the second).

CLASS EXERCISE

ADS (2018/19) - Lecture 4 - slide 3

Matrix Multiplication

Recall

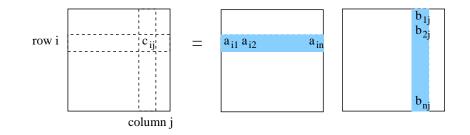

The product of two $(n \times n)$ -matrices

$$A = (a_{ij})_{1 \le i,j \le n}$$
 and $B = (b_{ij})_{1 \le i,j \le n}$

is the $(n \times n)$ -matrix C = AB where $C = (c_{ij})_{1 \le i,j \le n}$ with entries n

$$c_{ij}=\sum_{k=1}^{n}a_{ik}b_{kj}.$$

Matrix Multiplication

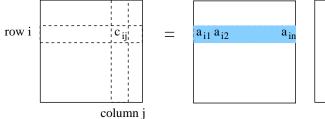

The Matrix Multiplication Problem

Input: $(n \times n)$ -matrices A and B *Output:* the $(n \times n)$ -matrix *AB*

ADS (2018/19) - Lecture 4 - slide 5

Matrix Multiplication

- *n* multiplications and *n* additions for each *c_{ii}*. - there are n^2 different c_{ij} entries.

ADS (2018/19) – Lecture 4 – slide 6

A straightforward algorithm

Algorithm MATMULT(*A*, *B*)

1.
$$n \leftarrow$$
 number of rows of A
2. for $i \leftarrow 1$ to n do
3. for $j \leftarrow 1$ to n do
4. $c_{ij} \leftarrow 0$
5. for $k \leftarrow 1$ to n do
6. $c_{ij} \leftarrow c_{ij} + a_{ik} \cdot b_{kj}$
7. return $C = (c_{ij})_{1 \le i,j \le n}$

Requires

 $\Theta(n^3)$

arithmetic operations (additions and multiplications).

A näive divide-and-conquer algorithm

Observe

row i

lf

$$A = \left(\begin{array}{c|c} A_{11} & A_{12} \\ \hline A_{21} & A_{22} \end{array} \right)$$
 and $B = \left(\begin{array}{c|c} B_{11} & B_{12} \\ \hline B_{21} & B_{22} \end{array} \right)$

for $(n/2 \times n/2)$ -submatrices A_{ij} and B_{ij} then

$$AB = \left(\begin{array}{c|c} A_{11}B_{11} + A_{12}B_{21} & A_{11}B_{12} + A_{12}B_{22} \\ \hline A_{21}B_{11} + A_{22}B_{21} & A_{21}B_{12} + A_{22}B_{22} \end{array}\right)$$

$$c_{ij} = \sum_{k=1}^{n} a_{ik} b_{kj} = \underbrace{\sum_{k=1}^{n/2} a_{ik} b_{kj}}_{\in A_{11}B_{12}} + \underbrace{\sum_{k=n/2+1}^{n} a_{ik} b_{kj}}_{\in A_{12}B_{22}}$$

A näive divide-and-conquer algorithm

ADS (2018/19) - Lecture 4 - slide 9

A näive divide-and-conquer algorithm (cont'd)

Assume n is a power of 2.

Algorithm D&C-MATMULT(A, B)

- 1. $n \leftarrow$ number of rows of A
- 2. if n = 1 then return $(a_{11}b_{11})$
- 3. else

4. Let A_{ij} , B_{ij} (for i, j = 1, 2) be $(n/2 \times n/2)$ -submatrices s.th. $A = \left(\frac{A_{11} | A_{12}}{A_{21} | A_{22}}\right) \text{ and } B = \left(\frac{B_{11} | B_{12}}{B_{21} | B_{22}}\right)$

5. Recursively compute $A_{11}B_{11}$, $A_{12}B_{21}$, $A_{11}B_{12}$, $A_{12}B_{22}$, $A_{21}B_{11}$, $A_{22}B_{21}$, $A_{21}B_{12}$, $A_{22}B_{22}$

6. Compute
$$C_{11} = A_{11}B_{11} + A_{12}B_{21}$$
, $C_{12} = A_{11}B_{12} + A_{12}B_{22}$,
 $C_{21} = A_{21}B_{11} + A_{22}B_{21}$, $C_{22} = A_{21}B_{12} + A_{22}B_{22}$
7. return $\left(\begin{array}{c|c} C_{11} & C_{12} \\ \hline C_{21} & C_{22} \end{array}\right)$

Analysis of $D\&C\mathchar`-Mathchar`Mult$

- T(n) is the number of operations done by D&C-MATMULT.
 - Lines 1, 2, 3, 4, 7 require $\Theta(1)$ arithmetic operations
 - Line 5 requires 8T(n/2) arithmetic operations
 - ► Line 6 requires 4(n/2)² = Θ(n²) arithmetic operations. Remember! Size of matrices is Θ(n²), NOT Θ(n)

We get the recurrence

$$T(n) = 8T(n/2) + \Theta(n^2).$$

Since $\log_2(8) = 3$, the Master Theorem yields

$$T(n) = \Theta(n^3).$$

Analysis of $D\&C\mathchar`-Mathchar`Mult$

T(n) is the number of operations done by D&C-MATMULT.

- ▶ Lines 1, 2, 3, 4, 7 require $\Theta(1)$ arithmetic operations
- Line 5 requires 8T(n/2) arithmetic operations
- ► Line 6 requires $4(n/2)^2 = \Theta(n^2)$ arithmetic operations. **Remember!** Size of matrices is $\Theta(n^2)$, NOT $\Theta(n)$

We get the recurrence

$$T(n) = 8T(n/2) + \Theta(n^2).$$

Since $\log_2(8) = 3$, the Master Theorem yields

$$T(n) = \Theta(n^3).$$

(No improvement over $MATMULT \dots$ why? CLASS? ...)

ADS (2018/19) - Lecture 4 - slide 11

Strassen's algorithm (cont'd)

$$P_{1} = (A_{11} + A_{22})(B_{11} + B_{22})$$

$$P_{2} = (A_{21} + A_{22})B_{11}$$

$$P_{3} = A_{11}(B_{12} - B_{22})$$

$$P_{4} = A_{22}(-B_{11} + B_{21})$$

$$P_{5} = (A_{11} + A_{12})B_{22}$$

$$P_{6} = (-A_{11} + A_{21})(B_{11} + B_{12})$$

$$P_{7} = (A_{12} - A_{22})(B_{21} + B_{22})$$

Strassen's algorithm (1969)

Assume n is a power of 2.

Let

$$A = \begin{pmatrix} A_{11} & A_{12} \\ \hline A_{21} & A_{22} \end{pmatrix} \text{ and } B = \begin{pmatrix} B_{11} & B_{12} \\ \hline B_{21} & B_{22} \end{pmatrix}$$

We want to compute

$$AB = \left(\begin{array}{c|c} A_{11}B_{11} + A_{12}B_{21} & A_{11}B_{12} + A_{12}B_{22} \\ \hline A_{21}B_{11} + A_{22}B_{21} & A_{21}B_{12} + A_{22}B_{22} \end{array} \right) \\ = \left(\begin{array}{c|c} C_{11} & C_{12} \\ \hline C_{21} & C_{22} \end{array} \right).$$

Strassen's algorithm uses a *trick* in applying Divide-and-Conquer.

Strassen's algorithm (cont'd)

Let

$$P_{1} = (A_{11} + A_{22})(B_{11} + B_{22})$$

$$P_{2} = (A_{21} + A_{22})B_{11}$$

$$P_{3} = A_{11}(B_{12} - B_{22})$$

$$P_{4} = A_{22}(-B_{11} + B_{21})$$

$$P_{5} = (A_{11} + A_{12})B_{22}$$

$$P_{6} = (-A_{11} + A_{21})(B_{11} + B_{12})$$

$$P_{7} = (A_{12} - A_{22})(B_{21} + B_{22})$$

Then

$$C_{11} = P_1 + P_4 - P_5 + P_7 \qquad C_{12} = P_3 + P_5 C_{21} = P_2 + P_4 \qquad C_{22} = P_1 + P_3 - P_2 + P_6$$
(**)

ADS (2018/19) – Lecture 4 – slide 13

Checking Strassen's algorithm - C11

We will check the equation for C_{11} is correct. Strassen's algorithm computes $C_{11} = P1 + P4 - P5 + P7$. We have

$$P1 = (A11 + A22)(B11 + B22)$$

= A11B11 + A11B22 + A22B11 + A22B22.
$$P4 = A22(-B11 + B21) = A22B21 - A22B11.$$
$$P5 = (A11 + A12)B22 = A11B22 + A12B22.$$
$$P7 = (A12 - A22)(B21 + B22)$$

= A12B21 + A12B22 - A22B21 - A22B22.

Then P1 + P4 = A11B11 + A11B22 + A22B22 + A22B21.

Checking Strassen's algorithm - C11

We will check the equation for C_{11} is correct. Strassen's algorithm computes $C_{11} = P1 + P4 - P5 + P7$. We have

> P1 = (A11 + A22)(B11 + B22)= A11B11 + A11B22 + A22B11 + A22B22. P4 = A22(-B11 + B21) = A22B21 - A22B11.P5 = (A11 + A12)B22 = A11B22 + A12B22.P7 = (A12 - A22)(B21 + B22)= A12B21 + A12B22 - A22B21 - A22B22.

> > ADS (2018/19) - Lecture 4 - slide 14

Checking Strassen's algorithm - C11

We will check the equation for C_{11} is correct. Strassen's algorithm computes $C_{11} = P1 + P4 - P5 + P7$. We have

> P1 = (A11 + A22)(B11 + B22)= A11B11 + A11B22 + A22B11 + A22B22. P4 = A22(-B11 + B21) = A22B21 - A22B11.P5 = (A11 + A12)B22 = A11B22 + A12B22.P7 = (A12 - A22)(B21 + B22)= A12B21 + A12B22 - A22B21 - A22B22.

Then P1 + P4 = A11B11 + A11B22 + A22B22 + A22B21. Then P1 + P4 - P5 = A11B11 + A22B22 + A22B21 - A12B22.

Checking Strassen's algorithm - C11

We will check the equation for C_{11} is correct. Strassen's algorithm computes $C_{11} = P1 + P4 - P5 + P7$. We have

> P1 = (A11 + A22)(B11 + B22)= A11B11 + A11B22 + A22B11 + A22B22. P4 = A22(-B11 + B21) = A22B21 - A22B11.P5 = (A11 + A12)B22 = A11B22 + A12B22.P7 = (A12 - A22)(B21 + B22)= A12B21 + A12B22 - A22B21 - A22B22.

Then P1 + P4 = A11B11 + A11B22 + A22B22 + A22B21. Then P1 + P4 - P5 = A11B11 + A22B22 + A22B21 - A12B22. Then P1 + P4 - P5 + P7 = A11B11 + A12B21, which is C11.

Checking Strassen's algorithm - C11

We will check the equation for C_{11} is correct. Strassen's algorithm computes $C_{11} = P1 + P4 - P5 + P7$. We have

> P1 = (A11 + A22)(B11 + B22)= A11B11 + A11B22 + A22B11 + A22B22. P4 = A22(-B11 + B21) = A22B21 - A22B11.P5 = (A11 + A12)B22 = A11B22 + A12B22.P7 = (A12 - A22)(B21 + B22)= A12B21 + A12B22 - A22B21 - A22B22.

Then P1 + P4 = A11B11 + A11B22 + A22B22 + A22B21. Then P1 + P4 - P5 = A11B11 + A22B22 + A22B21 - A12B22. Then P1 + P4 - P5 + P7 = A11B11 + A12B21, which is C11.

homework: check other 3 equations.

ADS (2018/19) - Lecture 4 - slide 14

Strassen's algorithm (cont'd)

Crucial Observation

Only **7** multiplications of $(n/2 \times n/2)$ -matrices are needed to compute *AB*.

Algorithm STRASSEN(A, B)

1. $n \leftarrow$ number of rows of A

2. **if**
$$n = 1$$
 then return $(a_{11}b_{11})$

- 3. else
- 4. Determine A_{ij} and B_{ij} for i, j = 1, 2 (as before)
- 5. Compute P_1, \ldots, P_7 as in (*)
- 6. Compute $C_{11}, C_{12}, C_{21}, C_{22}$ as in (**)

7. return $\begin{pmatrix} C_{11} & C_{12} \\ \hline C_{21} & C_{22} \end{pmatrix}$

Analysis of Strassen's algorithm

Let T(n) be the number of arithmetic operations performed by STRASSEN.

- Lines 1 4 and 7 require $\Theta(1)$ arithmetic operations
- ► Line 5 requires $7T(n/2) + \Theta(n^2)$ arithmetic operations
- Line 6 requires $\Theta(n^2)$ arithmetic operations. remember.

We get the recurrence

$$T(n) = 7T(n/2) + \Theta(n^2).$$

Since $\log_2(7) \approx 2.807 > 2$, the Master Theorem yields

 $T(n) = \Theta(n^{\log_2(7)}).$

ADS (2018/19) - Lecture 4 - slide 14

Breakthroughs on matrix multiplication

 Coppersmith & Winograd (1987) came up with an improved algorithm with running time of

 $\Theta(n^{2.376}).$

- many years of silence ...
- Then in his 2010 PhD thesis, Andrew Stothers from the School of Maths, at the University of Edinburgh got an algorithm with Θ(n^c) for c < 2.3737 ...</p>
 - \Rightarrow Coppersmith/Winograd not optimal.
 - But Stothers didn't publish.
- In December 2011, Virginia Vassilevska Williams of Stanford, came up with a Θ(n^c) algoithm, for c < 2.3727 (partly, but not only, making use of some of Stothers' ideas)

ADS (2018/19) - Lecture 4 - slide 17

3. Week 3 tutorial sheet :-)

Remarks on Matrix Multiplication

- In practice, the "school" MATMULT algorithm tends to outperform Strassen's algorithm, unless the matrices are huge.
- > The best known lower bound for matrix multiplication is

 $\Omega(n^2)$.

This is a *trivial* lower bound (need to look at all entries of each matrix). Amazingly, $\Omega(n^2)$ is believed to be "the truth"!

Open problem: Can we find a $O(n^{2+o(1)})$ -algorithm for Matrix Multiplication of $n \times n$ matrices?

ADS (2018/19) - Lecture 4 - slide 18
