AI Large Practical: Assignment 3

Alan Smaill

School of Informatics

Nov 9th 2016
The third assignment (Assignment 3) involves extending the system you developed in assignment 2 to allow for the typical situation where there is a proponent and opponent arguing about some conclusion, involving exchange of arguments and a notion of burden of proof.

The main credit will go to a report you are asked to write on the work you have done in both assignments, placed in context.
Stages

- look at some presentations of the use of argumentation systems in dialogue, and in particular the burden of proof; a starting point is in a paper mentioned below.

- extend your system to support interchange of arguments following the burden of proof;

- write a report on the work done, placed in context.
Reminder on your responsibility

You should write your own code and report. You are not permitted to
- copy programs which someone else wrote.
- show your own programs or report to other students.

but you are encouraged to have discussions with your colleagues.
Submission

Your are required to submit

- program source code, ensuring
  - that the comments allow a reader to understand the intention behind the code, together with
  - some example scenarios treated by your program, and
  - instructions on running the system.

- Your report.

Put all these in a single directory, and submit using the command in DICE:

```bash
submit ailp 3 <your-directory>
```

The deadline for Assignment 2 submission is

16:00 on Wed 21st December 2016
Burden of Proof

The first goal is to extend the system to allow a set of arguments to be put together cumulatively, as in a dialogue where a proponent aims to establish some conclusion, and an opponent to defeat it.

Read the paper “The Carneades model of argument and burden of proof” by Gordon, T. F., Prakken, H. & Walton, Artificial Intelligence, vol 171.¹ It describes informally how this can be represented in the Carneades framework.

You will need to work out first how best to approach this. It is probably best to work with an example along the lines described in the paper.

Critical questions

From the paper:

Besides being defeasible, argumentation schemes have a dialogical aspect in that they come with a set of critical questions [20], which enumerate ways of challenging arguments created using the scheme. Critical questions differ with regard to their impact on the burden of proof [3,43]. For some critical questions, merely asking the question is enough to shift the burden of proof back to the party who put forward the argument to answer the question. For other critical questions, the party who raised the question also has the burden of answering it. Carneades models critical questions as additional premises of an argument, with a different type of premise, called assumptions and exceptions, for each kind of question.
Burden of proof

From the paper:

*When the scheme for arguments from expert opinion is instantiated to create a specific argument, the critical questions can be represented in Carneades as assumptions and exceptions. Whether an assumption or exception is appropriate depends on who should have the burden of production, which is a policy issue dependent on the domain. If the respondent, the person who poses the critical question, should have the burden of production, then the critical question should be modeled as an exception.*
In a legal situation, the prosecution and defence start with each having a body of evidence they bring to bear, and arguments of the relevance of that evidence. You are being asked to model this process, with the shifting burden of proof.
What is to be done

- It is possible to model this simply by the execution of successive argumentation updates, taking into account the state of the argumentation graph at successive steps.
- A better submission will explicitly model where the burden of proof lies at each step.
- For a good submission, you should implement a selection criterion that chooses automatically an appropriate argument to introduce, depending on where the burden of proof lies. This should be based on the current state of the argumentation graph, and the arguments available to the proponent.
## Example sketch

<table>
<thead>
<tr>
<th>P/D?</th>
<th>Arg.id</th>
<th>Argument</th>
<th>Assumptions</th>
<th>murder accept?</th>
<th>BoP</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td></td>
<td>murder</td>
<td></td>
<td>no</td>
<td>P</td>
</tr>
<tr>
<td>P</td>
<td>arg1</td>
<td>[killing, malice], ~[§187 excluded] ⇒ murder</td>
<td>§187 is valid</td>
<td>yes</td>
<td>D</td>
</tr>
<tr>
<td>D</td>
<td>arg2</td>
<td>[self-defense], ~[§197 excluded] ⇒ §187 excluded</td>
<td>§197 is valid</td>
<td>no</td>
<td>D</td>
</tr>
<tr>
<td>D</td>
<td>arg3</td>
<td>[W1 'self-defense'], ~[W1 not credible] ⇒ self-defense</td>
<td>§197 is valid</td>
<td>no</td>
<td>P</td>
</tr>
<tr>
<td>P</td>
<td>arg4</td>
<td>[W2 'time to run away'], ~[W2 not credible] ⇒ ~self-defense</td>
<td>§197 is valid</td>
<td>no</td>
<td>P</td>
</tr>
</tbody>
</table>
The report

Your report should be not longer than 8 pages; there is a template for writing the report on the course web page. You do not have to use any particular word processing system, but an outline document will be provided in \LaTeX. Your report should be similar to some of the papers you have seen. For example, it should contain proper references to papers consulted, and sources of ideas. Don’t forget to make clear any ideas that you yourself have introduced.
Your report should

- explain the background to argumentation systems in general, and Carneades in particular — what are they for?
- Describe the functionality you have added to the system, and how you did this.
- Present test cases, explaining why you chose these particular test cases.
- Evaluate your final system as a tool — what are the strengths and weaknesses, how could it be improved.
Those reports that just describe what you did and what you got will not get good marks. Some thought is required in how best to present the test cases you will have run.
Assessment

The second assignment is worth 50% of the course mark. Remember, there is no exam. The marks are distributed as follows.

- **Programming** (10 marks)
  
  Will the program run by following `README` instructions?
  
  *a sanity check that the code does what is claimed*
Short report (40 marks)
This should be not longer than 8 pages, and should cover:

- Quick review of argumentation systems, what they are for etc.
- Description of Carneades in abstract, and initial implementation
- Description of enhanced system, what additional functionality is intended and how achieved
- Choice of experiments (experimental methodology)
- Presentation of results, analysis and conclusion

to pass, a presentation that sets the scene correctly, describes work done and gives some results
for A grade, a clear presentation that makes explicit the links between the intended functionality, the choice of experiments and justifies the results.
The report

Do aim to fit within the given space —
this is not an exercise in formatting, so slightly longer is OK.

It is easy to fill up the space —
think hard about how to structure this report.
There are different ways to structure the report; a couple of examples follow.
Example report structure

1. Introduction, the goal of the exercise.
2. The chosen methods were A, B, briefly explained.
3. The experiments used data sets X,Y,Z; they used the implemented methods as as follows.
   3.1 Results for A,
   3.2 Results for B,
4. The results show that method B gives best results, followed by A.
Another possible structure

1. Introduction: The goal.
   Method A was chosen because . . .
   It is expected that method A will give the following benefits,
   across all data sets. (hypothesis)
2. Outline of method algorithms.
3. Experiments: data sets, results summarised.
4. Conclusions: the hypothesis was right, in that A usually gave
   the expected benefits;
   it did not work so well on experiment 4;
   this may be because the arguments in that experiment had
   the following property . . .
References

- You are expected to provide references in your report, to relevant articles and other publications.
- The template gives examples of how to do this directly.
- There is a separate \texttt{bibtex} system that can help with this, integrated with LaTeX; it may be easier for just a small number of references to do this as in the template, however.
Next session

There will be a session on the second part of the assignment in the lecture slot next week:

9:00, Wednesday 16th November

This will cover more on report writing, and some ideas of scenarios that you could think of modelling in this way. Remember, most of the credit will be assigned based on the report. The drop-in sessions continue as before.
