Automated Reasoning

Coursework lecture: **Proving and Reasoning in Isabelle/HOL**

Daniel Raggi

18/10/2016

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Coursework overview

- Part 1: Propositional and first-order proofs [15%]
- ▶ Part 2: Structured proofs & powerful reasoning tools [25%]

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Part 3: Reasoning about Geometries [60%]

Part 1: Propositional and first-order proofs

Procedural proofs (sequence of rule applications).

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Part 1: Propositional and first-order proofs

Procedural proofs (sequence of rule applications).

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Introduction and elimination rules.

Part 1: Propositional and first-order proofs

- Procedural proofs (sequence of rule applications).
- Introduction and elimination rules.
- You should be reasonably skilled with these things by now.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

> You will solve complex problems.

- > You will solve complex problems.
- Isabelle has a lot of machinery built in for presentation, interaction and automation.

- You will solve complex problems.
- Isabelle has a lot of machinery built in for presentation, interaction and automation.

Structured proofs (also called *declarative*); the name of the language is *lsar*.

- You will solve complex problems.
- Isabelle has a lot of machinery built in for presentation, interaction and automation.
- Structured proofs (also called *declarative*); the name of the language is *lsar*.
- Powerful automatic tools: simp, auto, safe, blast, fast, force, fastforce, linarith, arith, presburger, algebra, meson, metis.

• A link to external provers: **sledgehammer**.

Rules:

$$\frac{t = s}{Pt} \frac{Ps}{subst} \qquad \frac{s = t}{Pt} \frac{Ps}{subst}$$
subst
$$\frac{s = t}{Pt} \text{ refl} \qquad \frac{s = t}{t = s} \text{ sym} \qquad \frac{r = s}{r = t} \frac{s = t}{t \text{ rans}}$$

$$\frac{\forall x. \ f \ x = g \ x}{f = g} \text{ ext}$$

Rules:

Are all of these rules necessary, or can some of them be derived from the others?

Output:a * 0 = 01. $\forall c. \exists a b. a + 3 * b = c$ $add_0: 0 + a = a$ add_commute: a + b = b + a

lemma " $\forall c$:: int. $\exists a b. a + 3 * b = c$ "

```
lemma "\forall c :: int. \exists a b. a + 3 * b = c"
apply (rule all!)
apply (rule_tac x = c in exl)
apply (rule_tac x = 0 in exl)
apply (rule_tac s = 0 and t = "3 * 0" in ssubst)
apply (rule mult_zero_right)
apply (rule_tac s = "0 + c" and t = "c + 0" in ssubst)
apply (rule add.commute)
apply (rule add_0)
done
```

| Output | mult_zero_right: | a * $0 = 0$ |
|-------------------------|------------------|-------------|
| Output: No subgoals! | add_0: | 0 + a = a |
| | add.commute: a + | b = b + a |

```
lemma "∀c :: int. ∃ a b. a + 3 * b = c"
apply (rule all!)
apply (rule_tac x = c in ex!)
apply (rule_tac x = 0 in ex!)
apply (subst mult_zero_right)
apply (subst add.commute)
apply (rule add_0)
done
```

We can save all that variable instantiation using subst; rewriting.

| Output: No subgoals! | mult_zero_right: | a * 0 = 0 |
|-------------------------|------------------|-----------|
| | add_0: | 0 + a = a |
| | add.commute: a + | b = b + a |

```
lemma "∀c :: int. ∃ a b. a + 3 * b = c"
apply (rule all!)
apply (rule_tac x = c in ex!)
apply (rule_tac x = 0 in ex!)
apply (simp only: mult_zero_right add.commute add_0)
done
```

Method simp does that automatically (given the right rules!).

| Output: No subgoals! | mult_zero_right: | a * $0 = 0$ |
|-------------------------|------------------|-------------|
| | add_0: | 0 + a = a |
| | add.commute: a + | b = b + a |

```
lemma "\forall c :: int. \exists a b. a + 3 * b = c"
apply (rule all!)
apply (rule_tac x = c in ex!)
apply (rule_tac x = 0 in ex!)
apply simp
done
```

Method simp does that automatically (given the right rules!). ...and the right rules are already in the Main library.

simp: rewriting using equations. Uses: apply simp apply (simp add: eq1 ... eqn) apply (simp only: $eq_1 \ldots eq_n$) apply (simp del: $eq_1 \ldots eq_n$) auto: rewriting + proof search (using classical logic). Uses: apply auto apply (auto simp add: $eq_1 \ldots eq_n$) apply (auto simp only: $eq_1 \ldots eq_n$) apply (auto simp del: $eq_1 \ldots eq_n$)

simp: rewriting using equations. Uses: apply simp apply (simp add: eq1 ... eqn) apply (simp only: eq₁ ... eq_n) apply (simp del: $eq_1 \ldots eq_n$) auto: rewriting + proof search (using classical logic). Uses: apply auto apply (auto simp add: $eq_1 \ldots eq_n$) apply (auto simp only: $eq_1 \ldots eq_n$) apply (auto simp del: $eq_1 \ldots eq_n$)

Others: blast, fast, force, fastforce, safe, algebra, linarith, arith, presburger, meson, metis.

Sledgehammer

Structured proofs look much more like maths.

- The proofs you can build right now read like a list of instructions.
- Mathematical proofs (and written arguments in general) don't look like that!
- Structured proofs look much more like maths.

```
lemma "\forall c :: int. \exists a b. a + 3 * b = c"
proof (writing nothing after 'proof' applies a default rule; e.g. all1)
fix c::int
have "c + 3 * 0 = c" by simp
thus "\exists a b. a + 3 * b = c" by blast
qed
```

Example (using keywords assume, obtain and hence/then have/from \cdots have):

```
lemma "\forall c :: int. (\exists a. 4 * a = c) \longrightarrow (\exists b. 2 * b = c)"
proof (rule allI, rule impI)
    fix c :: int
    assume "\exists a. 4 * a = c"
    then obtain a where P: "4 * a = c" by auto
    hence "2 * (2 * a) = c" by simp
    thus "\exists b. 2 * b = c" by blast
ged
```

Example (using keywords assume, obtain and hence/then have/from \cdots have):

```
lemma "\forall c :: int. (\exists a. 4 * a = c) \longrightarrow (\exists b. 2 * b = c)"
proof (rule allI, rule impI)
fix c :: int
assume "<math>\exists a. 4 * a = c"
then obtain a where P: "4 * a = c" by auto
hence "2 * (2 * a) = c" by simp
thus "\exists b. 2 * b = c" by blast
ged
```

Example (using keywords assume, obtain and hence/then have/from \cdots have):

```
lemma "\forall c :: int. (\exists a. 4 * a = c) \longrightarrow (\exists b. 2 * b = c)"
proof (rule allI, rule impI)
    fix c :: int
    assume "\exists a. 4 * a = c"
    then obtain a where P: "4 * a = c" by auto
        then have "2 * (2 * a) = c" by simp
        thus "\exists b. 2 * b = c" by blast
ged
```

Example (using keywords assume, obtain and hence/then have/from \cdots have):

```
lemma "\forall c :: int. (\exists a. 4 * a = c) \longrightarrow (\exists b. 2 * b = c)"
proof (rule allI, rule impI)
    fix c :: int
    assume "<math>\exists a. 4 * a = c"
    then obtain a where P: "4 * a = c" by auto
    from this have "2 * (2 * a) = c" by simp
    thus "\exists b. 2 * b = c" by blast
ged
```

Example (using keywords assume, obtain and hence/then have/from \cdots have):

```
lemma "\forall c :: int. (\exists a. 4 * a = c) \longrightarrow (\exists b. 2 * b = c)"
proof (rule allI, rule impI)
fix c :: int
assume "<math>\exists a. 4 * a = c"
then obtain a where P: "4 * a = c" by auto
from P have "2 * (2 * a) = c" by simp
thus "\exists b. 2 * b = c" by blast
ged
```

Yet another way to write the proof (with **from** assms or **using** assms):

```
lemma mylemma:
  fixes c :: int
  assumes "\exists a. 4 * a = c"
  shows "\exists b. 2 * b = c"
proof -
  from assms obtain a where "4 * a = c" by auto
  hence "2 * (2 * a) = c" by simp
  thus "\exists b. 2 * b = c" by blast
ged
```

Yet another way to write the proof (with **from** assms or **using** assms):

There is also calculation using '...', moreover and ultimately.

 $have \qquad \ \ "a = b" \quad by < some \ method > \\ moreover \ have \ \ "... = c" \quad by < some \ method > \\ moreover \ have \ \ "... = d" \quad by < some \ method > \\ ultimately \ show \ \ "a = d" \quad by \ auto$

Moreover *collects* results and **ultimately** uses them (like using keyword **from**). This corresponds to:

a = b= c= d.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Defining a function recursively: primrec or fun.

```
primrec listsum :: "nat list \Rightarrow nat" where

"listsum (h::t) = h + listsum t"

| "listsum [] = 0"
```

Isabelle adds simplification rules automatically for recursive definitions. For this example: listsum.simps and mymult.simps

A proof by induction:

```
lemma "even (x^2 + x::nat)"
proof (induction x)
  case 0
  show "even (0^2 + 0 :: nat)" by simp
  case (Suc x)
   from Suc obtain y where
     P: "2 * v = x^2 + x" by (metis evenE)
  have "((x :: nat) + 1)^2 + x + 1 = (x^2 + 2 * x + 1) + x + 1" by algebra
   moreover have "... = x^2 + 2 * x + x + 2" by simp
   moreover have "... = x^2 + x + (2 * x + 2)" by simp
   moreover have "... = 2 * y + 2 * x + 2" using P by simp
   moreover have "... = 2 * (y + x + 1)" by simp
   ultimately have "((x :: nat) + 1)^2 + x + 1 = 2 * (y + x + 1)" by simp
   thus "even ((\operatorname{Suc} x)^2 + \operatorname{Suc} x)" by simp
ged
```

- If in your proof in paper it's clear that results P and Q are used in the proof, then try using P Q sledgehammer
- This gives the provers a hint.
- Preinstantiate variables when trying to use a result in a proof: using P[where x = "some term"] Q sledgehammer.

- When in doubt add brackets.
- When in doubt *add type constraints*.

- Always solve the problems in your head (or on paper), before applying rules!
- If in your proof in paper it's clear that results P and Q are used in the proof, then try using P Q sledgehammer
- This gives the provers a hint.
- Preinstantiate variables when trying to use a result in a proof: using P[where x = "some term"] Q sledgehammer.
- When in doubt add brackets.
- When in doubt *add type constraints*.
- During a proof, if you know your goal is unprovable (e.g., false), go back one step!

- When in doubt *add type constraints*.
- During a proof, if you know your goal is unprovable (e.g., false), go back one step!
- Counterexample checkers (Quickcheck, Nitpick) can help you realise you made a wrong turn. Either call them directly (typing quickcheck or nitpick), or simply type try.
