## Solution for Tutorial 8: Joint Distributions; Expectation and Variance

## Week 9 (08-12 March, 2010)

## 1. Joint and Marginal Distributions

Two psychometric tests are administered to a group of 10 experimental subjects. The first test is a standardized aptitude test used for university admissions. It returns a score between 0 and 100. Let $X$ be the random variable denoting the aptitude test score. The second psychometric test is a memory test. It measures the digit span, i.e., the number of digits in a sequence that a subject is able to remember before they make a mistake. Let $Y$ be the random variable that denotes the digit span, ranging from 1 to 5 . The results of the experiment are given in the following table:

| Subject | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $x$ | 60 | 50 | 40 | 50 | 60 | 30 | 30 | 20 | 30 | 50 |
| $y$ | 5 | 3 | 3 | 3 | 3 | 3 | 3 | 4 | 4 | 4 |

(a) Compute the distributions of $X$ and $Y$.
(b) Compute the joint distribution of $X$ and $Y$.
(c) Compute the marginal distributions of $X$ and $Y$.
(d) Are $X$ and $Y$ independent?
(e) Compute the conditional distributions of $X$ given $Y=3$.

## Solution:

(a)

| $f(x)$ | 0.1 | 0.3 | 0.1 | 0.3 | 0.2 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $y$ | 3 | 4 | 5 |  |  |

| $f(y)$ | 0.6 | 0.3 | 0.1 |
| :--- | :--- | :--- | :--- |

(b)

| $(x, y)$ | 20 | 30 | 40 | 50 | 60 |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 3 | 0 | 0.2 | 0.1 | 0.2 | 0.1 |
| 4 | 0.1 | 0.1 | 0 | 0.1 | 0 |
| 5 | 0 | 0 | 0 | 0 | 0.1 |

(c)

| $(x, y)$ | 20 | 30 | 40 | 50 | 60 | $\sum_{x} f(x, y)$ |
| :---: | :--- | :--- | :--- | :--- | :--- | :---: |
| 3 | 0 | 0.2 | 0.1 | 0.2 | 0.1 | 0.6 |
| 4 | 0.1 | 0.1 | 0 | 0.1 | 0 | 0.3 |
| 5 | 0 | 0 | 0 | 0 | 0.1 | 0.1 |
| $\sum_{y} f(x, y)$ | 0.1 | 0.3 | 0.1 | 0.3 | 0.2 |  |

(d) No, for example $f(40,3)=0.1$, but $\sum_{y} f(40, y) \cdot \sum_{x} f(x, 3)=0.1 \cdot 0.6=0.06$
(e)

| $x$ | 20 | 30 | 40 | 50 | 60 |
| :---: | :--- | :--- | :--- | :--- | :--- |
| $y=3$ | 0 | 0.67 | 1 | 0.67 | 0.5 |

## 2. Expectation and Variance

(a) For the discrete random variable $X$ with the following probability distribution:

$$
f(x)=\frac{|x-2|}{7} \text { for } x=-1,0,1,2,3
$$

determine $E(X)$ and $\operatorname{var}(X)$. Now assume the functions $g(X)=3 X+2$ and $h(X)=X^{2}$ and determine $E(g(X))$ and $E(h(X))$.

$$
\begin{aligned}
& \text { Solution: } \\
& \qquad \begin{array}{c}
E(X)=\sum_{x} x \cdot f(x)=-1 \frac{3}{7}+0 \frac{2}{7}+1 \frac{1}{7}+2 \frac{0}{7}+3 \frac{1}{7}=\frac{1}{7} \\
\operatorname{var}(X)=\sum_{x}(x-\mu)^{2} \cdot f(x)=\left(-1-\frac{1}{7}\right)^{2} \frac{3}{7}+\left(0-\frac{1}{7}\right)^{2} \frac{2}{7}+\left(1-\frac{1}{7}\right)^{2} \frac{1}{7}+\left(2-\frac{1}{7}\right)^{2} \frac{0}{7}+\left(3-\frac{1}{7}\right)^{2} \frac{1}{7} \\
E(g(X))=\sum_{x} 3 x+2 \cdot f(x)=-1 \frac{3}{7}+2 \frac{2}{7}+5 \frac{1}{7}+8 \frac{0}{7}+11 \frac{1}{7}=\frac{16}{7} \\
E(h(X))=\sum_{x} x^{2} \cdot f(x)=(-1)^{2} \frac{3}{7}+0^{2} \frac{2}{7}+1^{2} \frac{1}{7}+2^{2} \frac{0}{7}+3^{2} \frac{1}{7}=\frac{13}{7}
\end{array}
\end{aligned}
$$

(b) In Chebyshev's theorem, which form does the inequality take for $k=1,2,3,4$ ?

Solution: The general form of Chebyshev's theorem is:

$$
P(|x-\mu|<k \sigma) \geq 1-\frac{1}{k^{2}}
$$

So we get for $k=1,2,3,4$ :

$$
\begin{gathered}
P(|x-\mu|<\sigma) \geq 0 \\
P(|x-\mu|<2 \sigma) \geq \frac{3}{4} \\
P(|x-\mu|<3 \sigma) \geq \frac{8}{9} \\
P(|x-\mu|<4 \sigma) \geq \frac{15}{16}
\end{gathered}
$$

## 3. Covariance

The covariance of two random variables $X$ and $Y$ with the joint distribution $f(x, y)$ is defined as:

$$
\operatorname{cov}(X, Y)=E\left(\left(X-\mu_{X}\right)\left(Y-\mu_{Y}\right)\right)=\sum_{x} \sum_{y}\left(x-\mu_{X}\right)\left(y-\mu_{Y}\right) \cdot f(x, y)
$$

where $\mu_{X}$ and $\mu_{Y}$ are the means of $X$ and $Y$.
Assume that $X$ and $Y$ have the following joint distribution:

| $(x, y)$ | 0 | 1 | 2 |
| :---: | :---: | :---: | :---: |
| 0 | $\frac{1}{6}$ | $\frac{1}{3}$ | $\frac{1}{12}$ |
| 1 | $\frac{2}{9}$ | $\frac{1}{6}$ | 0 |
| 2 | $\frac{1}{36}$ | 0 | 0 |

(a) Compute the marginal distributions of $X$ and $Y$.
(b) Use the marginal distributions to compute $\mu_{X}$ and $\mu_{Y}$.
(c) Now compute the covariance of $X$ and $Y$.

## Solution:

(a) The marginal distributions are:

| $(x, y)$ | 0 | 1 | 2 |  |
| :---: | :---: | :---: | :---: | :---: |
| 0 | $\frac{1}{6}$ | $\frac{1}{3}$ | $\frac{1}{12}$ | $\frac{7}{12}$ |
| 1 | $\frac{2}{9}$ | $\frac{1}{6}$ | 0 | $\frac{7}{18}$ |
| 2 | $\frac{1}{36}$ | 0 | 0 | $\frac{1}{36}$ |
|  | $\frac{5}{12}$ | $\frac{1}{2}$ | $\frac{1}{12}$ |  |

(b)

$$
\begin{aligned}
& \mu_{X}=0 \frac{5}{12}+1 \frac{1}{2}+2 \frac{1}{12}=\frac{2}{3} \\
& \mu_{Y}=0 \frac{7}{12}+1 \frac{7}{18}+2 \frac{1}{36}=\frac{4}{9}
\end{aligned}
$$

(c)

$$
\operatorname{cov}(X, Y)=\sum_{x} \sum_{y}\left(x-\frac{2}{3}\right)\left(y-\frac{4}{9}\right) \cdot f(x, y)=-\frac{7}{54}
$$
