

# Computer Graphics

An Introduction

Taku Komura

# Computer Graphics

- Images and movies produced by computers
- Applied in many areas nowadays, becoming an important topic of our society.

## Applications:

- Films
- Computer games
- Virtual reality, augmented reality
- Medicine
- 3D design
- Scientific visualization

# Computer Graphics is about animation (films)

# Games are very important in Computer Graphics

# VR and AR

# Medical Imaging is another driving force

# Computer Aided Design too

# Scientific Visualisation

# What's this course all about?

*We will cover...*

- Graphics programming and algorithms
- Graphics data structures
- Colour
- Applied geometry, modelling and rendering

# First Lecture

Some definitions

Fundamental units we use in these processes

Summary of this course

describing through the graphics pipeline

# Graphics Definitions

## Point

a location in space, 2D or 3D  
sometimes denotes one pixel

## Line

straight path connecting two points  
infinitesimal width, consistent density  
beginning and end on points

# Graphics Definitions

- Vertex

point in 3D

- Edge

line in 3D connecting two vertices

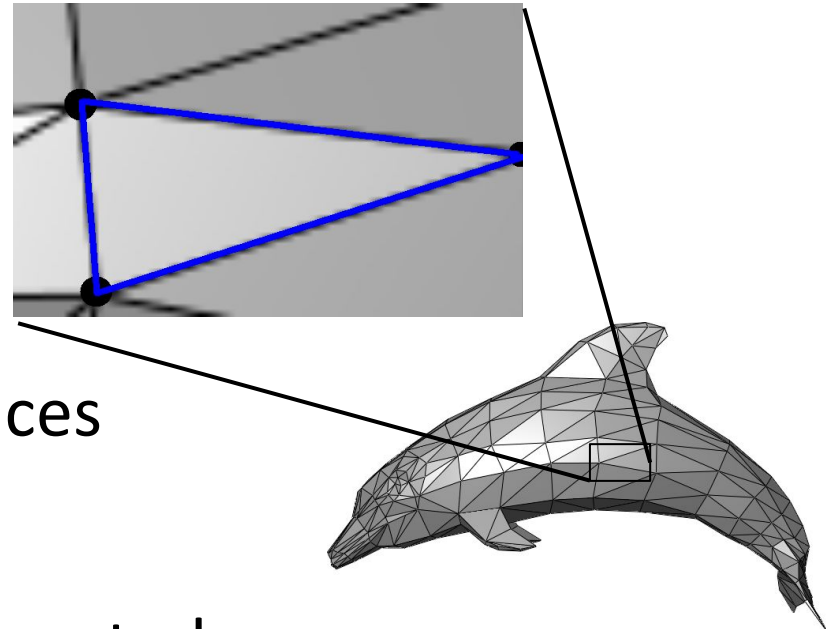

- Polygon/Face/Facet

arbitrary shape formed by connected vertices

fundamental unit of 3D computer graphics

- Mesh

set of connected polygons forming a surface (or object)

# Graphics Definitions

Rendering : process of generating an image from the model

Framebuffer : a video output device that drives a video display from a memory containing the color for every pixel

# Overview of the Course

- Graphics Pipeline (Today)
  - (Local lighting effects) Illumination, lighting, shading, mirroring, shadowing
  - Rasterization (creating the image using the 3D scene)
- Ray tracing
- Global illumination
- Modelling
  - Curves and Surfaces

# Graphics/Rendering Pipeline

- Graphics processes generally execute sequentially
- Pipelining the process means dividing it into stages
- Especially when rendering in **real-time**, different hardware resources are assigned for each stage

# Graphics / Rendering Pipeline

There are three stages

Application Stage

Geometry Stage

Rasterization Stage

# An example through the pipeline...

The scene we are trying to represent:

# Application Stage

Entirely done in software by the CPU

- Read Data

Load the geometry of the scene,

User's input by mice, trackballs, trackers, or sensing gloves

- In response to the user's input, the application stage change the view or scene

# 3D Shape Models

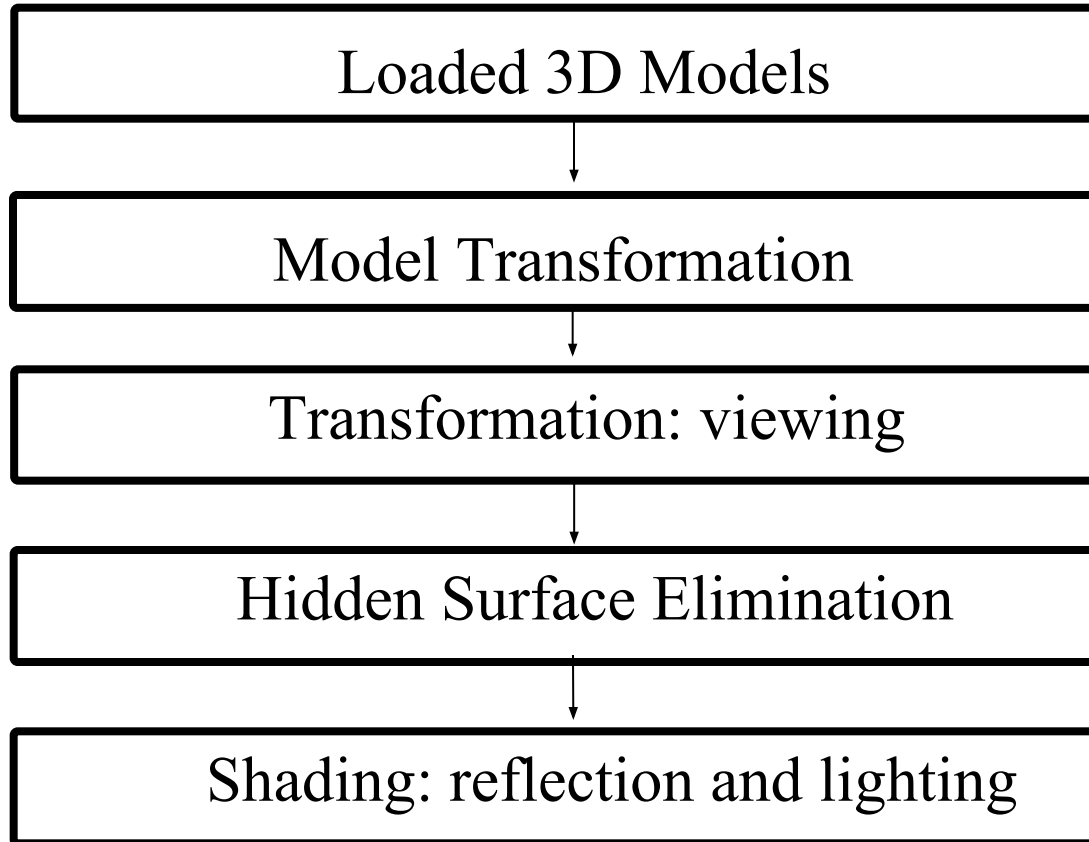

Designed by polygons, parametric curves/surfaces, implicit surfaces and etc.

Defined in its own coordinate system

# Geometry Stage (Geometry Pipeline)

Models, user  
inputs

3D scene  
data

# Model Transformation

Objects put into the scene by applying translation, scaling and rotation

Linear transformation called homogeneous transformation is used

The location of all the vertices are updated by this transformation

# Perspective Projection

We want to create a picture of the scene viewed from the camera

We apply a perspective transformation to convert the 3D coordinates to 2D coordinates of the screen

Objects far away appear smaller, closer objects appear bigger

# Hidden Surface Removal

Objects occluded by other objects must not be drawn

# Shading

Now we need to decide the colour of each pixels taking into account the object's colour, lighting condition and the camera position

point light source

# Shading – Flat Shading

Objects coloured based on its own colour and the lighting condition

One colour for one face

# Gouraud shading, no specular highlights

Lighting calculation per vertex

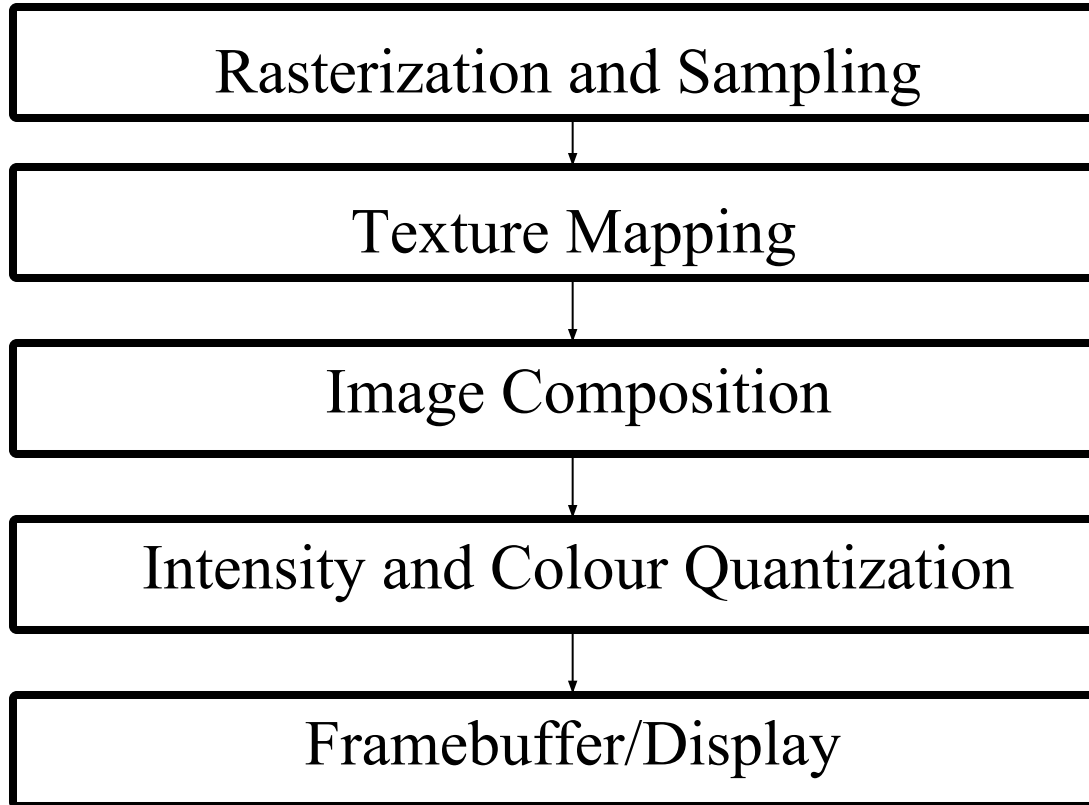

# Specular highlights added

# Rasterization Stage (imaging pipeline)

3D Scene Data

# Rasterization

- Converts the vertex information output by the geometry pipeline into pixel information needed by the video display
- Aliasing: distortion artifacts produced when representing a high-resolution signal at a lower resolution.
- Anti-aliasing : technique to remove aliasing

# Anti-aliasing

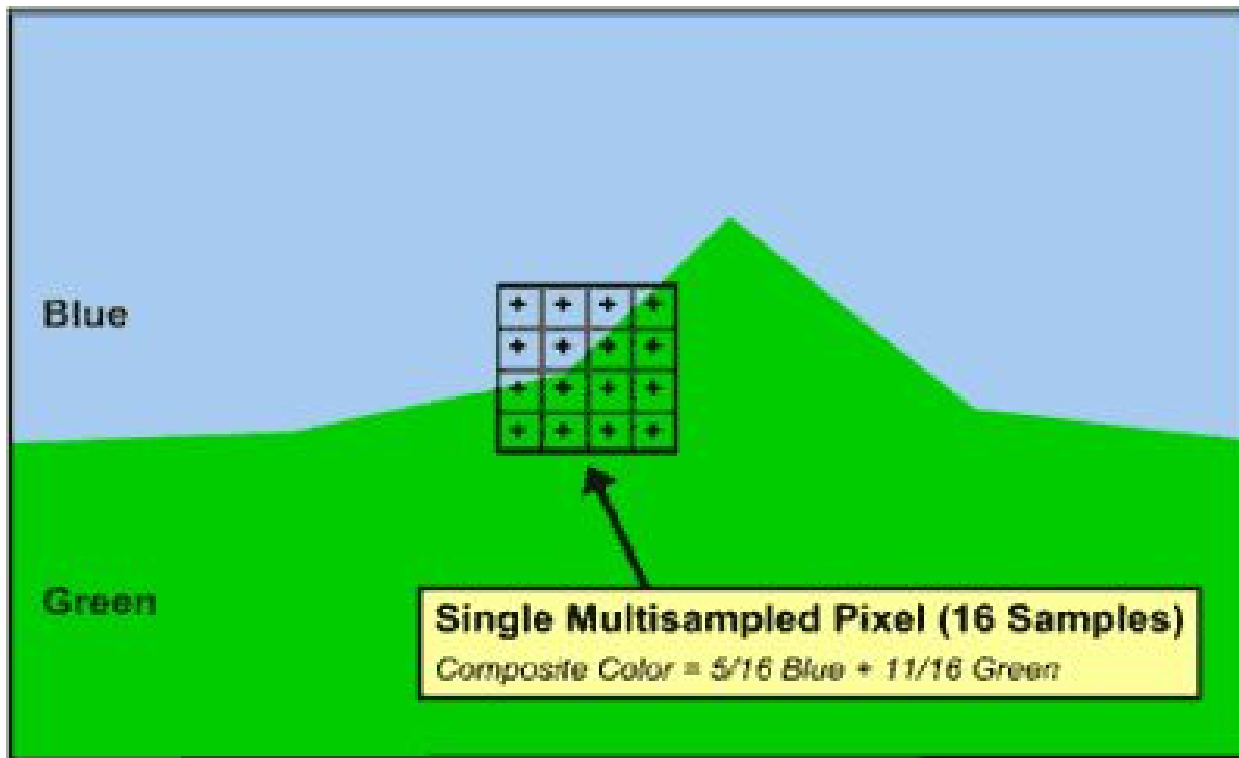

**Aliased polygons  
(jagged edges)**

**Anti-aliased polygons**

- ✓ How is *anti-aliasing* done? Each pixel is subdivided (sub-sampled) in n regions, and each sub-pixel has a color;
- ✓ Compute the average color value

# Texture mapping

# Other covered topics: Reflections, shadows, bump mapping

# Other covered topics: Reflections

# Other covered topics: Shadows

# Other covered topics: Bump mapping

# Other covered topics: Ray Tracing

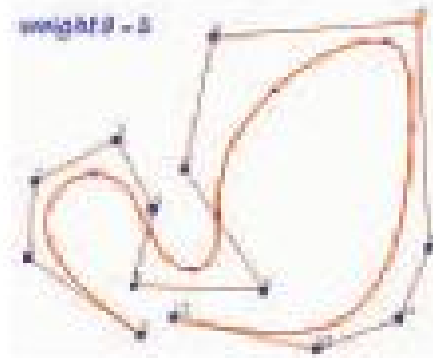

# Other covered topics: Global Illumination

\*

# Polynomial Curves, Surfaces

# Course support resources

Graphics course website

<http://www.inf.ed.ac.uk/teaching/courses/cg>

lecture material,

recommended reading,

Links to support material for lectures and projects,

Practical description and resources

# Some notifications

- 16 lectures in total
- 2 practicals
- Some tutorials (probably two) about the practicals

# Books

Fundamentals of Computer Graphics  
Shirley and Marschner, CRC Press, 2010.  
Available online via the library

[Tomas Akenine-Möller](#), [Eric Haines](#), and [Naty Hoffman](#),  
1045 pages, from [A.K.  
Peters Ltd.](#), 3rd edition,  
ISBN 987-1-56881-424-7,  
2008,

.

Computer Graphics Principles  
and Practice  
Foley, van Dam, Feiner and  
Hughes, Addison Wesley, 1997.

Introduction to Computer  
Graphics  
Foley, van Dam, Feiner, Hughes  
and Phillips, Addison Wesley,  
1995.

# Summary

The course is about algorithms, **NOT** applications

Lots of mathematics

Graphics execution is a pipelined approach

Basic definitions presented

Some support resources indicated
