

Research using the Internet

Computer Literacy 1 lecture 5
30/09/08

Topics

- Topics
 - Internet
 - The Web
 - Search engines
 - Classified directories
 - Evaluating data

Aims

- Know which search tool to use
- Able to assess quality of sources

The Internet

- The internet is a system of interconnected computer networks.
 - Formed by thousands of networks run by businesses, governments, universities etc.
 - Internet allows different users to communicate e.g. using email or instant messaging (chatting)
 - Another possibility to communicate is using the World Wide Web (www) by creating own website.

The Internet

The Web

- The WWW is a distributed browsing and searching system originally developed at CERN by Tim Berners-Lee
- The web was started in 1990 as a way for users to share access to files
- The files that can be accessed are known as documents
- The programs that allow you to display the files on your computer are known as browsers.

Hypertext

- Webpages are written in format that allows to be read by browsers
 - The content is annotated with information about how the content should be displayed
- One key feature of the annotation is that a word in one page can be linked to another webpage
- Words annotated in this way are called **HYPertext**

<http://en.wikipedia.org/wiki/Hypertext>

HTML and HTTP

- The language used for this annotation is **Hypertext Markup Language** → HTML
- Documents linked together using hypertext are called websites
- Computers that store websites are called **Web Servers**
- Each website has a unique address code called a **URL (uniform resource locator)** → browsers need this information to access webservers

HTML and HTTP

- HTTP = **H**ypertext **T**ransfer **P**rotocol
 - Is a web standard protocol for how browsers and servers communicate
 - Example: The URL for the University of Edinburg is <http://www.ed.ac.uk>, where http is the transfer and www.ed.ac.uk is the domain specific address of the host containing the information

Features of the Web

- Huge variety of information sources
- Available 24 hours
- Can be up-to-date
- Accessible from any computer

The Web

- It's unregulated
 - Free from censorship (matter of opinion)
 - Little quality control
 - No standard vocabulary
- Sometimes difficult to search

Search Engines

- Build databases of indexed websites
 - Automatically created
 - Normally don't cover the whole web
 - Can't access databases
 - No quality control
- Search by keywords only
 - Results ranked by relevance and your preferences

Search engines

- General queries
 - Generate many hits
 - Often with low relevance
- Good for
 - Specific queries e.g. particular people or organisations
 - Finding lots of information

Examples of Metasearch Engines

- Surf wax has 2 interesting interface features
 - Information about the author
 - Visual interface to help assess the relevance of the multitude of hits

<http://www.surf wax.com>

Other metasearch engines include

Metacrawler, DogPile, Webcrawler, HotBot

Matched in Context (School Informatics)

- University of Edinburgh **School of Informatics** - Wikipedia, the free encyclopedia
- University of Edinburgh **School of Informatics**
- The **School of Informatics** is an academic unit of the University of Edinburgh, in Scotland, responsible for research, teaching, outreach and commercialisation in **Informatics**
- Research in the **School of Informatics** draws on these component disciplines and much of it is interdisciplinary in nature
- The **school** is especially well known for research in the areas of artificial intelligence, computational linguistics, systems biology and theoretical computer science but also contributes to many other areas of **informatics**
- The **school** has a research staff of over 130 individuals, and an academic staff of 75
- The **school** was ranked 1st in the UK according to the Guardian University Tables 2008[1]
- The **School of Informatics** was awarded a 5*A in the UK government's HEFCE Research Assessment Exercise, the only computer science department in the country to achieve this highest possible rating

Key Points

- From Wikipedia, the free encyclopedia
- It was created in 1998 from the former Department of Artificial Intelligence, the Centre for Cognitive Science and the Department of

Classified Directory

- Database of websites collected manually
 - Records organised systematically
 - Some quality check
 - Only records of websites are searched
 - Smaller web coverage than engines
- Good for general enquiries
 - Allows browsing
 - Wide coverage of subjects

Example: <http://dir.yahoo.com/>

Subject gateways

- Classified directories for subject areas
 - For higher education (you!)
 - High quality
 - Good coverage of subject
 - Links
- Good for browsing a subject area
 - Get reliable information

Evaluating Sources

- Author → Who wrote this?
- Date → When? Is it frequently updated?
- Bias → Why?
- Reliability → What else have they written?
- Structure → How?
- URL → Which organisation is behind it

Referencing Sources

- Where appropriate (especially in academic context) you should acknowledge your sources of information
- There are a number of different conventions this, including footnotes and reference lists
- Plagiarism is BAD and a form of intellectual theft!

Key Points

- Internet and Web (HTML, HTTP)
- Browser (FireFox, Explorer, Safari, Opera)
- Search Engines (Google, www.Yahoo)
 - Specific queries
- Classified directories (dir.Yahoo)
 - General queries
- Subject Gateways (BIOME)
 - High quality information
- Evaluate your sources!
