# Data Intensive Linguistics — Lecture 9 Parsing (I): Context-free grammars and chart parsing

Philipp Koehn 6 February 2006

Philipp Koehn DIL Lecture 9 6 February 20

A simple sentence

I like the interesting lecture

#### The path so far

- $\bullet$  Originally, we treated language as a sequence of words  $\rightarrow$  n-gram language models
- Then, we introduced the notion of syntactic properties of words
   → part-of-speech tags
- $\bullet \ \, \text{Now, we look at } \, \text{syntactic relations} \, \text{between words} \\ \rightarrow \, \text{syntax trees}$

#### Syntactic relations

DIL Lecture 9

I like the interesting lecture PRO VB DET JJ NN

- The adjective interesting gives more information about the noun lecture
- $\bullet$  The determiner  $\emph{the}$  says something about the noun  $\emph{lecture}$

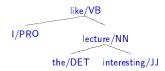

Philipp Koehn

- The noun *lecture* is the object of the verb *like*, specifying *what* is being liked
- The pronoun / is the subject of the verb like, specifying who is doing the liking

Philipp Koehn DIL Lecture 9 6 February 2006

## Dependency structure

This can also be visualized as a dependency tree:

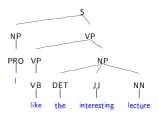

Philipp Koehn DIL Lecture 9 6 February 2006

#### 7 informatics

finformatics

#### Phrase-structure tree

A popular grammar formalism is **phrase structure grammar** Internal nodes combine leaf nodes into phrases, such as *noun phrases (NP)* 

#### nformatics

#### Dependency structure (2)

The dependencies may also be labeled with the type of dependency

1	like	the	interesting	lecture

#### **Building phrase-structure trees**

- Our task for this week: parsing
  - given: an input sentence with part-of-speech tags
  - wanted: the right syntax tree for it
- Formalism: context-free grammars
  - non-terminal nodes such as NP, S appear inside the tree
  - terminal nodes such as like, lecture appear at the leafs of the tree
  - rules such as  $NP \rightarrow DET JJ NN$

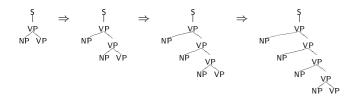

Philipp Koehn DIL Lecture 9 6 February 2006

#### NN → lecture I like the interesting NN I like the interesting lecture

#### nformatics

#### Recursion

Rules can be applied **recursively**, for example the rule  $VP \rightarrow NP VP$ 

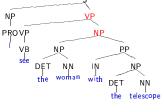

Philipp Koehn DIL Lecture 9 6 February 2006

#### Why is parsing hard?

Prepositional phrase attachment: Who has the telescope?

• We have input sentence: I like the interesting lecture • We have a set of context-free rules:

DIL Lecture 9 Philipp Koehi 6 February 2006

**CYK Parsing** 

S ightarrow NP VP, NP ightarrow PRO, PRO ightarrow  $I_r$  VP ightarrow VP NP, VP ightarrow VB, VB ightarrow  $like_r$ 

NP o DET JJ NN, DET o the, JJ o, NN o lecture

• Cocke-Younger-Kasami (CYK) parsing - a bottom-up parsing algorithm - uses a chart to store intermediate result

• Chomsky hierarchy of formal languages (terminals in caps, non-terminal lowercase)

Input

NP VP

PRO VP

/ VP

/ VP NE

/ VB NP

*I like* NP

I like DET JJ NN

I like the JJ NN

Philipp Koehn

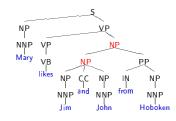

- regular: only rules of the form  $A \to a, A \to B, A \to Ba$  (or  $A \to aB$ ) Cannot generate languages such as  $a^nb^n$
- context-free: left-hand side of rule has to be single non-terminal, anything goes on right hand-side. Cannot generate  $a^nb^nc^n$
- context-sensitive: rules can be restricted to a particular context, e.g.  $\alpha A\beta \to \alpha aBc\beta$ , where  $\alpha$  and  $\beta$  are strings of terminal and non-terminals
- Moving up the hierarchy, languages are more expressive and parsing becomes computationally more expensive
- Is natural language context-free?
