

Informatics 1

Functional Programming Lectures 1 and 2

Monday 26–Tuesday 27 September 2011

Introduction, Functions

Philip Wadler

University of Edinburgh

Welcome to Informatics 1, Functional Programming!

Course head: Ewan Klein

Functional programming (Inf1-FP)

Instructor: Philip Wadler

Teaching assistant: Phil Scott

Computation and logic (Inf1-CL)

Instructor: Dave Robertson

Teaching assistant: Shahriar Bijani

Informatics Teaching Organization (ITO):

Kristin Belk, Tamise Totterdell

Where to find us

IF – Informatics Forum (across the street)

AT – Appleton Tower (this building)

Course head: [Ewan Klein](mailto:ewan@inf.ed.ac.uk) ewan@inf.ed.ac.uk IF 2.11

Functional programming (Inf1-FP)

Instructor: [Philip Wadler](mailto:wadler@inf.ed.ac.uk) wadler@inf.ed.ac.uk IF 5.31

Teaching assistant: [Phil Scott](mailto:phil.scott@ed.ac.uk) phil.scott@ed.ac.uk IF 2.05

Informatics Teaching Organization (ITO):

[Kristin Belk](#), [Tamise Totterdell](#) AT 4.02

Required text and reading

Haskell: The Craft of Functional Programming (Third Edition),
Simon Thompson, Addison-Wesley, 2011.

Reading assignment

Monday 26 September 2011	Chapters 1–3 (pp. 1–66)
Monday 3 October 2011	Chapters 4–7 (pp. 67–176)
Monday 10 October 2011	Chapters 8–9 (pp. 177–212)

Lab Week Exercise and Drop-In Labs

Monday	3–4pm	Computer Lab West
Tuesday	2–3pm	Computer Lab West
Wednesday	2–3pm	Computer Lab West
Thursday	2–3pm	Computer Lab West
Friday	3–4pm	Computer Lab North

Computer Lab West and North – Appleton Tower, fifth floor

Lab Week Exercise

submit by 5pm Friday 30 September 2011

do all the parts

Tutorials

ITO will assign you to tutorials, which start in Week 3.

Tuesday/Wednesday Computation and Logic

Thursday/Friday Functional Programming

Do the tutorial work *before* the tutorial!

Bring a *printout* of your work to the tutorial!

You may *collaborate*, but you are responsible for knowing the material.

Mark of 0% means you have no incentive to *plagiarize*.

Formative vs. Summative

0%	Lab week exercise
0%	Tutorial 1
0%	Tutorial 2
0%	Tutorial 3
10%	Class Test
0%	Tutorial 4
0%	Tutorial 5
0%	Tutorial 6
0%	Tutorial 7
0%	Mock Test
0%	Tutorial 8
90%	Final Exam

Any questions?

Any questions?

Questions make you *look good*!

Phil's *secret technique* for asking questions.

Phil's *secret goal* for this course

Part I

Introduction

Computational Thinking

“In their capacity as a tool computers will be but a ripple on the surface of our culture. In their capacity as intellectual challenge, they are without precedent in the cultural history of mankind.”

Edsger Dijkstra, 1930–2002

“Informatics” vs. “Computer Science”

“Computer science is no more about computers than astronomy is about telescopes.”

Edsgar Dijkstra, 1930–2002

Why learn Haskell?

- Important to learn many languages over your career
- Functional languages increasingly important in industry
- Puts experienced and inexperienced programmers on an equal footing
- Operate on data structure *as a whole* rather than *piecemeal*
- Good for concurrency, which is increasingly important

What is Haskell?

- A functional programming language
- For use in education, research, and industry
- Designed by a committee
- Mature—over 20 years old!

“A History of Haskell: being lazy with class”,

Paul Hudak (Yale University),

John Hughes (Chalmers University),

Simon Peyton Jones (Microsoft Research),

Philip Wadler (Edinburgh University),

*The Third ACM SIGPLAN History of Programming Languages
Conference (HOPL-III),*

San Diego, California, June 9–10, 2007.

Look at these web pages:

ICFP 2011

Tsuru Capital

Sushi Gonpachi

Families of programming languages

- Functional

Erlang, F#, Haskell, Hope, Javascript, Miranda, O'Caml, Racket, Scala, Scheme, SML

- More powerful
- More compact programs

- Object-oriented

C++, F#, Java, Javascript, O'Caml, Perl, Python, Ruby, Scala

- More widely used
- More libraries

Functional programming in the real world

- Google MapReduce, Sawzall
- Ericsson AXE phone switch
- Perl 6
- DARCS
- XMonad
- Yahoo
- Twitter
- Facebook
- Garbage collection

Functional programming is the new new thing

Erlang, F#, Scala attracting a lot of interest from developers

Features from functional languages are appearing in other languages

- **Garbage collection** Java, C#, Python, Perl, Ruby, Javascript
- **Higher-order functions** Java, C#, Python, Perl, Ruby, Javascript
- **Generics** Java, C#
- **List comprehensions** C#, Python, Perl 6, Javascript
- **Type classes** C++ “concepts”

Part II

Functions

What is a function?

- A recipe for generating an output from inputs:
“Multiply a number by itself”

- A set of (input, output) pairs:
(1,1) (2,4) (3,9) (4,16) (5,25) ...

- An equation:

$$f\ x = x^2$$

- A graph relating inputs to output (for numbers only):

Kinds of data

- Integers: 42, -69
- Floats: 3.14
- Characters: 'h'
- Strings: "hello"
- Pictures: 

Applying a function

```
invert :: Picture -> Picture
```

```
knight :: Picture
```

```
invert knight
```

Composing functions

`beside :: Picture -> Picture -> Picture`

`flipV :: Picture -> Picture`

`invert :: Picture -> Picture`

`knight :: Picture`

`beside (invert knight) (flipV knight)`

Defining a new function

```
double :: Picture -> Picture
```

```
double p = beside (invert p) (flipV p)
```

```
double knight
```

Defining a new function

```
double :: Picture -> Picture  
double p = beside (invert p) (flipV p)
```

```
double knight
```

Terminology

Type signature

```
double :: Picture -> Picture
```

Function declaration

```
double p = beside (invert p) (flipV p)
```

The diagram illustrates the components of a function declaration. A blue dot is placed under the word 'double' in the code. A vertical blue line extends from this dot to the text 'function name' below it. A horizontal green line is drawn under the entire right-hand side of the equation, 'beside (invert p) (flipV p)'. A vertical green line extends from the center of this horizontal line to the text 'function body' below it.

Terminology

Part III

The Rule of Leibniz

Operations on numbers

```
[culross]wadler: ghci
```

```
  _ _ _ _ _  
 / _ _ \ / \ / \ / _ _ ( _ )  
 / / _ \ / / / _ / / / | |  
 / / _ \ \ / _ _ / / _ _ | |  
 \ _ _ _ / \ / / _ / \ _ _ _ / | _ |
```

```
GHC Interactive, version 6.7  
http://www.haskell.org/ghc/  
Type :? for help.
```

```
Loading package base ... linking ... done.
```

```
Prelude> 3+3
```

```
6
```

```
Prelude> 3*3
```

```
9
```

```

```

Functions over numbers

squares.hs

```
square :: Integer -> Integer  
square x = x * x
```

```
pyth :: Integer -> Integer -> Integer  
pyth a b = square a + square b
```

Testing our functions

```
[culross]wadler: ghci squares.hs
```

```
    ---      ---  
  /  _  \  /\  /\ /  _  (  
 /  / _ \  /  /  /  |  |  
/  / _ \  _  /  /  _  |  |  
\  _  _  /\  /  _  _  /  |  |
```

```
GHC Interactive, version 6.7  
http://www.haskell.org/ghc/  
Type :? for help.
```

```
Loading package base ... linking ... done.
```

```
[1 of 1] Compiling Main                ( squares.hs, interpreted )
```

```
Ok, modules loaded: Main.
```

```
*Main> square 3
```

```
9
```

```
*Main> pyth 3 4
```

```
25
```

```
*Main>
```

A few more tests

```
*Main> square 0
```

```
0
```

```
*Main> square 1
```

```
1
```

```
*Main> square 2
```

```
4
```

```
*Main> square 3
```

```
9
```

```
*Main> square 4
```

```
16
```

```
*Main> square (-3)
```

```
9
```

```
*Main> square 10000000000
```

```
10000000000000000000000000
```

Declaration and evaluation

Declaration (file squares.hs)

```
square :: Integer -> Integer
square x = x * x
```

```
pyth :: Integer -> Integer -> Integer
pyth a b = square a + square b
```

Evaluation

```
[culross]wadler: ghci squares.hs
```

```
    _ _ _ _ _
   / _ \ / \ / \ / \ ( _ )
  / / _ \ / / / _ / / / | |
 / / _ \ / _ / / / _ | |
\_ _ _ / \ / _ / \ _ _ / | _ |
```

```
GHC Interactive, version 6.7
http://www.haskell.org/ghc/
Type :? for help.
```

```
Loading package base-1.0 ... linking ... done.
```

```
Compiling Main ( squares.hs, interpreted )
```

```
Ok, modules loaded: Main.
```

```
*Main> pyth 3 4
```

```
25
```

```
*Main>
```

The Rule of Leibniz

```
square :: Integer -> Integer  
square x = x * x
```

```
pyth :: Integer -> Integer -> Integer  
pyth a b = square a + square b
```

```
pyth 3 4  
=  
square 3 + square 4  
=  
3*3 + 4*4  
=  
9 + 16  
=  
25
```

The Rule of Leibniz

- Identity of Indiscernables: “No two distinct things exactly resemble one another.” — Leibniz

That is, two objects are identical if and only if they satisfy the same properties.

- “A difference that makes no difference is no difference.” — Spock
- “Equals may be substituted for equals.” — My high school teacher

Numerical operations are functions

$(+) :: \text{Integer} \rightarrow \text{Integer} \rightarrow \text{Integer}$

$(*) :: \text{Integer} \rightarrow \text{Integer} \rightarrow \text{Integer}$

```
Main*> 3+4
```

```
7
```

```
Main*> 3*4
```

```
12
```

$3 + 4$ *stands for* $(+) \ 3 \ 4$

$3 * 4$ *stands for* $(*) \ 3 \ 4$

```
Main*> (+) 3 4
```

```
7
```

```
Main*> (*) 3 4
```

```
12
```

Precedence and parentheses

Function application takes *precedence* over infix operators.

(Function applications *binds more tightly than* infix operators.)

$$\begin{aligned} & \text{square } 3 + \text{square } 4 \\ = & \\ & (\text{square } 3) + (\text{square } 4) \end{aligned}$$

Multiplication takes *precedence* over addition.

(Multiplication *binds more tightly than* addition.)

$$\begin{aligned} & 3*3 + 4*4 \\ = & \\ & (3*3) + (4*4) \end{aligned}$$

Associativity

Addition is *associative*.

$$\begin{aligned} & 3 + (4 + 5) \\ = & \\ & 3 + 9 \\ = & \\ & 12 \\ = & \\ & 7 + 5 \\ = & \\ & (3 + 4) + 5 \end{aligned}$$

Addition *associates to the left*.

$$\begin{aligned} & 3 + 4 + 5 \\ = & \\ & (3 + 4) + 5 \end{aligned}$$

Part IV

QuickCheck

QuickCheck properties

squares_prop.hs

```
import Test.QuickCheck
```

```
square :: Integer -> Integer  
square x = x * x
```

```
pyth :: Integer -> Integer -> Integer  
pyth a b = square a + square b
```

```
prop_square :: Integer -> Bool  
prop_square x =  
    square x >= 0
```

```
prop_squares :: Integer -> Integer -> Bool  
prop_squares x y =  
    square (x+y) == square x + 2*x*y + square y
```

```
prop_pyth :: Integer -> Integer -> Bool  
prop_pyth x y =  
    square (x+y) == pyth x y + 2*x*y
```

Running the program

```
[culross]wadler: ghci squares_prop.hs
GHCi, version 6.8.3: http://www.haskell.org/ghc/ :? for help
Loading package base ... linking ... done.
[1 of 1] Compiling Main          ( squares_prop.hs, interpreted )
*Main> quickCheck prop_square
Loading package old-locale-1.0.0.0 ... linking ... done.
Loading package old-time-1.0.0.0 ... linking ... done.
Loading package random-1.0.0.0 ... linking ... done.
Loading package mtl-1.1.0.1 ... linking ... done.
Loading package QuickCheck-2.1 ... linking ... done.
+++ OK, passed 100 tests.
*Main> quickCheck prop_squares
+++ OK, passed 100 tests.
*Main> quickCheck prop_pyth
+++ OK, passed 100 tests.
```

Part V

The Rule of Leibniz (reprise)

Gottfried Wilhelm Leibniz (1646–1716)

Gottfried Wilhelm Leibniz (1646–1716)

Anticipated symbolic logic, discovered calculus (independently of Newton), introduced the term “monad” to philosophy.

“The only way to rectify our reasonings is to make them as tangible as those of the Mathematicians, so that we can find our error at a glance, and when there are disputes among persons, we can simply say: Let us calculate, without further ado, to see who is right.”

“In symbols one observes an advantage in discovery which is greatest when they express the exact nature of a thing briefly and, as it were, picture it; then indeed the labor of thought is wonderfully diminished.”
