Lists and Recursion

Don Sannella

University of Edinburgh

Part I

Lists and Recursion

Cons and append

Cons takes an element and a list.

Append takes two lists.

```
(:)   :: a -> [a] -> [a]
(++) :: [a] -> [a] -> [a]

1 : [2,3]        =   [1,2,3]
[1] ++ [2,3]     =   [1,2,3]
[1,2] ++ [3]     =   [1,2,3]
'l' : "ist"      =   "list"
"l" ++ "ist"     =   "list"
"li" ++ "st"     =   "list"

[1] : [2,3]             -- type error!
1 ++ [2,3]              -- type error!
[1,2] ++ 3              -- type error!
"l" : "ist"             -- type error!
'l' ++ "ist"            -- type error!
```

`(:)` is pronounced *cons*, for *construct*

`(++)` is pronounced *append*

Lists

Every list can be written using only `(:)` and `[]`.

```
[1,2,3]   =  1 : (2 : (3 : []))

"list"    =  ['l','i','s','t']
          =  'l' : ('i' : ('s' : ('t' : [])))
```

A *recursive* definition: A *list* is either

- *empty*, written `[]`, or
- *constructed*, written `x:xs`, with *head* `x` (an element), and *tail* `xs` (a list).

A list of numbers

```
Prelude> null [1,2,3]
False
Prelude> head [1,2,3]
1
Prelude> tail [1,2,3]
[2,3]
Prelude> null [2,3]
False
Prelude> head [2,3]
2
Prelude> tail [2,3]
[3]
Prelude> null [3]
False
Prelude> head [3]
3
Prelude> tail [3]
[]
Prelude> null []
True
```

Part II

Mapping: Square every element of a list

Two styles of definition—squares

Comprehension

```
squares :: [Integer] -> [Integer]
squares xs  =  [ x*x | x <- xs ]
```

Recursion

```
squaresRec :: [Integer] -> [Integer]
squaresRec []       =  []
squaresRec (x:xs)   =  x*x : squaresRec xs
```

Pattern matching and conditionals

Pattern matching

```
squaresRec :: [Integer] -> [Integer]
squaresRec []        =  []
squaresRec (x:xs)    =  x*x : squaresRec xs
```

Conditionals with binding

```
squaresCond :: [Integer] -> [Integer]
squaresCond ws  =
  if null ws then
    []
  else
    let
      x  = head ws
      xs = tail ws
    in
      x*x : squaresCond xs
```

How recursion works—squaresRec

```
squaresRec :: [Integer] -> [Integer]
squaresRec []        =  []
squaresRec (x:xs)    =  x*x : squaresRec xs
```

```
squaresRec [1,2,3]
```

How recursion works—squaresRec

```
squaresRec :: [Integer] -> [Integer]
squaresRec []       =  []
squaresRec (x:xs)   =  x*x : squaresRec xs

   squaresRec [1,2,3]
=
   squaresRec (1 : (2 : (3 : [])))
```

How recursion works—squaresRec

```
squaresRec :: [Integer] -> [Integer]

sumSqOddRec :: [Integer] -> Integer
sumSqOddRec []                          =   0
sumSqOddRec (x:xs) | isOdd x            =   x*x + sumSqOddRec xs
                   | otherwise          =   sumSqOddRec xs
```

```
   sumSqOddRec [1,2,3]
=
   sumSqOddRec (1 : (2 : (3 : [])))
=
   1*1 + sumSqOddRec (2 : (3 : []))
=
   1*1 + sumSqOddRec (3 : [])
=
   1*1 + (3*3 + sumSqOddRec [])
=
   1*1 + (3*3 + 0)
=
   1 + (9 + 0)
=
   10
```

How recursion works—sumSqOddRec

```
sumSqOddRec :: [Integer] -> Integer
sumSqOddRec []                   =  0
sumSqOddRec (x:xs) | isOdd x     =  x*x + sumSqOddRec xs
                   | otherwise   =  sumSqOddRec xs
```

```
   sumSqOddRec [1,2,3]
=
   sumSqOddRec (1 : (2 : (3 : [])))
=
   1*1 + sumSqOddRec (2 : (3 : []))
=
   1*1 + sumSqOddRec (3 : [])
=
   1*1 + (3*3 + sumSqOddRec [])
=
   1*1 + (3*3 + 0)
=
   1 + (9 + 0)
=
   10
```
