

Informatics 2A 2015–16

Lecture 31

Revision Lecture

John Longley

Shay Cohen

Reminder: pass criteria

By 4pm tomorrow, you will have completed your coursework. This accounts for 25% of the course mark.

The remaining 75% of the course mark is provided by the exam.

For a **pass** in Inf2A, you need all of the following:

- At least 40% combined total mark.
- At least 35% in the exam.
- At least 25% on the assessed coursework.

The 2015 Inf2A Exam

December exam time and location:

INFR08008 - Informatics 2A

Location: Patersons Land - G1 (Surname Ahari - Mikolajczak), Patersons Land - 1.18 (Surname Milloy - Roy), Patersons Land - 1.26 (Surname Saev - Vosloo), Patersons Land - G.21 (Surname Wallbridge - Zimmerman)

Date/Time: Saturday 12/12/2015, 09:30:00-11:30:00

This is copied from the Registry exam timetable

<http://www.scripts.sasg.ed.ac.uk/registry/examinations/>

which is the **official** exam timetable. Make sure that you use this link to double-check **all** your exam times (including Inf2A).

A resit exam will be held in **August 2016**.

Exam structure

The exam is pen-and-paper, and lasts **2 hours**.

Calculators may be used, but you must bring your own. It must be one from an approved list of models specified by College:

http://www.cltc.scieng.ed.ac.uk/docs/open/Paper_D.pdf

The exam consists of:

- Part A: 5 compulsory short questions, worth 10% each.
Guideline time per question: 10 minutes
- Part B: a choice of 2 out of 3 longer questions, worth 25% each.

Guideline time per question: 30 minutes

The guideline times allow 10 minutes for reading and familiarising yourself with the exam paper.

Part A questions

The 5 compulsory short questions were new in 2012 and replaced 20 multiple-choice questions in previous years.

The questions will be similar in style and length (but not necessarily in topic) to the questions on this week's Tutorial 9.

The multiple-choice questions of previous years still provide good revision material in terms of coverage of topics.

Revision office hours

John Longley (IF 4.11): Wed 9 Dec, 10–12 am

Shay Cohen (IF 4.26): Thurs 10 Dec, 11 am–1 pm

Examinable material

Examinable material: formal language thread

Lectures 3–12

All of the material on regular and context-free languages (Lectures 3–12) should be considered as examinable.

Lectures 13, 27

The details of Micro-Haskell (MH) (syntax, type-checking and semantics), covered in Lecture 13, are **not** examinable.

However, the general principles of types, type-checking and abstract syntax, from Lecture 13, **are** examinable.

The whole of Lecture 27 (semantics of programming languages, in particular MH) may be considered **non-examinable**.

Examinable material: formal language thread (continued)

Lectures 28–30

Examinable: Most of Lecture 28: Idea of context-free pumping lemma. The notions of context-sensitive, noncontracting and unrestricted grammar. Definitions of Chomsky levels 0 and 1. Standard examples of context-sensitive but not context-free languages (though not the proofs of these facts).

Examinable: Broad ideas from Lectures 29 and 30. Correspondence between linear-bounded automata and Type 1, and between Turing Machines and Type 0. Example of a Type 0 language that is not Type 1. General notions of decidable, semidecidable and undecidable problems.

Non-examinable: Technical details from lectures 29, 30. E.g. Detailed definitions of Turing machines and linearly bounded automata, proof of undecidability of halting problem, examples of undecidable problems in general mathematics.

Kinds of exam question: formal language thread

Broadly speaking, 2 styles of question in exam.

Algorithmic problems: Minimizing a DFA, converting NFA to DFA, executing a PDA, LL(1) parsing using parse table, generating parse table from LL(1) grammar, ...

When the algorithm is **complex** (e.g., minimization, calculating first and follow sets), it may be easier to work directly with the definitions rather than following the algorithm strictly.

Non-algorithmic problems: Converting DFA to regular expression, designing regular expression patterns, applying pumping lemma, designing CFGs, converting CFG to LL(1), parsing using CSG or noncontracting grammar, ...

Examinable material: natural language thread

The main thing being tested is your ability to apply *and understand* the methods for solving certain standard kinds of problems.

Algorithmic problems:

- POS tagging via bigrams or Viterbi algorithm (lecture 16).
- CYK and Earley parsing (lectures 18, 19).
- Tree probabilities; probabilistic CYK; inferring probabilities from a corpus; lexicalization of rules (lectures 20, 21).
- Computing semantics, including β -reduction (lecture 24).

Examinable material: natural language thread (continued)

Non-algorithmic problems (simple examples only!)

- Design of a transducer for some morphology parsing task (lecture 14).
- Design of context-free rules for some feature of English. (Includes parameterized rules for agreement — lecture 22.)
- Adding semantic clauses to a given context-free grammar (lectures 23, 24).
- Converting an English sentence to a formula of FOPL (lecture 23).

Examinable material: natural language thread (continued)

General topics

- The language processing pipeline (lecture 2).
- Kinds of ambiguity (lectures 2, 15, 17, 24).
- The Chomsky hierarchy, and where human languages sit (lectures 2, 25).
- The *general idea* of parts of speech (lecture 16).
- Word distribution and Zipf's law (lecture 16).
- Very basic Python.

The ideas of recursive descent and shift-reduce parsing (lecture 17) are only **weakly examinable**.

Non-examinable material: natural language thread

- Specific knowledge of linguistics (everything you need will be given in the question).
- Details of particular POS tagsets; ability to do POS tagging by hand (lecture 15).
- Fine-grained typing, e.g. selectional restrictions on verbs (lecture 22).
- Linear indexed grammars (lecture 25).
- Human parsing (lecture 26)

All natural language examples will be taken from English!

Follow-on Informatics courses

Compiling techniques (UG3)

Covers the entire language-processing pipeline for programming languages, aiming at effective **compilation**: translating code in a high-level source language (Java, C, Haskell, ...) to equivalent code in a low-level target language (machine code, bytecode)

Syllabus includes lexing and parsing from a more practical perspective than in Inf2A.

Majority of course focused on latter stages of language-processing pipeline. Converting lexed and parsed source-language code into equivalent target-language code.

Introduction to theoretical computer science (UG3)

This will look at models of computation (register machines, Turing machines, lambda-calculus) and their different influences on computing practice.

One thread will address the boundaries between what is not computable at all (**undecidable** problems), what is computable in principle (**decidable** problems), and what is computable in practice (**tractable** problems). A major goal is to understand the famous **P = NP** question.

Another thread will look at the influence **lambda-calculus** has had, as a model of computation, on programming language design and practice, including LISP, OCaml, Haskell and Java.

Natural Languages: what we've done, what we haven't.

NLs are endlessly complex and fascinating. In this course, we have barely scratched the surface.

There's a world of difference between doing NLP with small **toy grammars** (as in this course) and **wide-coverage** grammars intended to cope with real-world speech/text.

- Ambiguity is the norm rather than the exception.
- Empirical and statistical techniques (involving text corpora) come to the fore, as distinct from logical and symbolic ones.

Coping with the richness and complexity of real-world language is still a largely unsolved problem!

Discourse structure.

In this course, we haven't considered any structure above the level of sentences. In practice, higher level **discourse** structure is crucial. E.g.

The Tin Man went to the Emerald City to see the Wizard of Oz and ask for a heart. Then **he** waited to see whether **he** would give **it** to **him**.

Or compare:

- John hid Bill's car keys. He was drunk.
- John hid Bill's car keys. He likes spinach. (??)

Deep vs. shallow processing.

Roughly, the further we go along the NLP pipeline, the deeper our analysis.

- Many apparently 'shallow' NLP tasks (e.g. spell checking; speech transcription) can benefit from the use of 'deeper' techniques such as parsing.
- On the other hand, for many seemingly 'deep' tasks (e.g. machine translation), current state-of-the-art techniques are surprisingly 'shallow' (e.g. use of N-gram techniques with massive corpora).

Follow-on courses in NLP

- **Foundations of Natural Language Processing** [UG3]. Empirical rather than theoretical in focus. Material on text corpora, N-grams, the 'noisy channel' model. A bit on the discourse level.
- **Machine Translation** [UG4]. Mainly on shallow techniques for MT: e.g. phrase-based models. Find out how Google Translate works!
- **Natural Language Understanding** [UG4]. Considers the LP pipeline much in the spirit of Inf2a, but including discourse level. Surveys both deep and shallow approaches.
- **Topics in Natural Language Processing** [UG4]. Get acquainted with state of the art in NLP and read cutting-edge research papers in NLP and machine learning.

Thank you!!

Hope you've enjoyed Inf2A,
and good luck with the exam!

Please complete the online course questionnaire when it
becomes available.
