(slides adapted from Robert Wilensky)

Informatics 2D

Situations

Idea:

- Introduce a notion of *situations*, which are logical **terms**
 - Consist of initial situation (usually called S_0) and all situations generated by applying an action to a situation.
- State facts about situations.
 - By relativizing predications to situations.
 - E.g., instead of saying just **On(A,B)**, say (somehow) **On(A,B)** in situation S_0
- Actions are thus
 - performed in a situation, and
 - produce new situations with new facts.
 - Examples: Forward and Turn(Right)

Informatics 2D

Using Logic to Plan

- We need ways of:
 - representing the world.
 - representing the goal.
 - representing how actions change the world.
- We haven't said much about the last.
 - **Difficulty:** After an action, new things are true, and some previously true facts are no longer true.

Informatics 2D

Representing Predications Relative to a Situation

- Can add an argument for a situation to each predicate that can change.
 - E.g., instead of **On(A,B)**, write **On(A,B, S_0)**
- Alternatively, introduce a predicate **Holds** and turn **On**, etc., into *functions*:
 - E.g., **Holds(On(A,B), S_0)**
 - What do things like **On(A,B)** now mean?
 - Either a category of situations, in which **A** is on **B**, or a set of those situations.

Informatics 2D

How This Will Work

- Before some action, we might have in our KB:
 $\text{On}(\mathbf{A},\mathbf{B},\mathbf{S}_0)$
 $\text{On}(\mathbf{B},\mathbf{Table},\mathbf{S}_0)$

- After an action that moves A to the table, say, we add
 $\text{Clear}(\mathbf{B},\mathbf{S}_1)$
 $\text{On}(\mathbf{A},\mathbf{Table},\mathbf{S}_1)$

- All these propositions are true. We have dealt with the issue of change, by keeping track of what is true when.

Informatics 2D

Same Thing, Slightly Different Notation

- Before :
 $\text{Holds}(\text{On}(\mathbf{A},\mathbf{B}),\mathbf{S}_0)$
 $\text{Holds}(\text{On}(\mathbf{B},\mathbf{Table}),\mathbf{S}_0)$
 ...

- After, add
 $\text{Holds}(\text{Clear}(\mathbf{B}),\mathbf{S}_1)$
 $\text{Holds}(\text{On}(\mathbf{A},\mathbf{Table}),\mathbf{S}_1)$

Informatics 2D

Representing Actions

- Need to represent:
 - Results of doing an action
 - Conditions that need to be in place to perform an action.
- For convenience, we will define *functions* to abbreviate actions:
 - E.g., $\text{Move}(\mathbf{A},\mathbf{B})$ denotes the *action type* of moving \mathbf{A} onto \mathbf{B} .
 - These are action *types*, because actions themselves are specific to time, etc.
- Now, introduce a *function Result*, designating “the situation resulting from doing an action type in some situation”.
 - E.g., $\text{Result}(\text{Move}(\mathbf{A},\mathbf{B}),\mathbf{S}_0)$ means “the situation resulting from doing an action of type $\text{Move}(\mathbf{A},\mathbf{B})$ in situation \mathbf{S}_0 ”.

Informatics 2D

How This Works

- Keep in mind that things like
 $\text{Result}(\text{Move}(\mathbf{A},\mathbf{B}),\mathbf{S}_0)$
 are *terms*, and denote *situations*.
 They can appear anywhere we would expect a situation.
- So we can say things like
 $\mathbf{S}_1 = \text{Result}(\text{Move}(\mathbf{A},\mathbf{B}),\mathbf{S}_0)$,
 $\text{On}(\mathbf{A},\mathbf{B},\text{Result}(\text{Move}(\mathbf{A},\mathbf{B}),\mathbf{S}_0))$,
 $\text{On}(\mathbf{A},\mathbf{B},\mathbf{S}_1)$, etc.
 (Alternatively, $\text{Holds}(\text{On}(\mathbf{A},\mathbf{B}),\text{Result}(\text{Move}(\mathbf{A},\mathbf{B}),\mathbf{S}_0))$,
 etc.)

Informatics 2D

Axiomatizing Actions

- Now, we can describe the results of actions, together with their preconditions.
- E.g., 'If nothing is on x and y, then one can move x to on top of y, in which case x will then be on y.'

$$\forall x,y,s \text{ Clear}(x,s) \wedge \text{Clear}(y,s) \\ \Rightarrow \text{On}(x,y,\text{Result}(\text{Move}(x,y),s))$$

- Alternatively:

$$\forall x,y,s \\ \text{Holds}(\text{Clear}(x),s) \wedge \text{Holds}(\text{Clear}(y),s) \\ \Rightarrow \text{Holds}(\text{On}(x,y), \text{Result}(\text{Move}(x,y),s))$$

- This is an *effect axiom*.

- It includes a precondition as well.

Informatics 2D

Situation Calculus

- This approach is called the *situation calculus*.
- We axiomatize all our actions, then use a general theorem prover to prove that a situation exists in which our goal is true.
- The actions in the proof would comprise our plan.

Informatics 2D

A Very Simple Example

KB:

$\text{On}(A,\text{Table},S_0)$

$\text{On}(B,C,S_0)$

$\text{On}(C,\text{Table},S_0)$

$\text{Clear}(A,S_0)$

$\text{Clear}(B,S_0)$

and axioms about actions, etc.

Goal:

$\exists s'. \text{On}(A,B,s')$

Informatics 2D

What happens?

- We try to prove $\text{On}(A,B,s')$ for some s'
 - Find axiom

$$\forall x,y,s. \text{Clear}(x,s) \wedge \text{Clear}(y,s) \\ \Rightarrow \text{On}(x,y,\text{Result}(\text{Move}(x,y),s))$$
 - By chaining, e.g., goal would be true if we could prove $\text{Clear}(A,s) \wedge \text{Clear}(B,s)$ by backward chaining.
 - But both are true in S_0 , so we can conclude $\text{On}(A,B,\text{Result}(\text{Move}(A,B),S_0))$
- We are done!
- We look in the proof and see only one action, $\text{Move}(A,B)$, which is executed in situation S_0 , so this is our plan.

Informatics 2D

Tougher Example: Same Initial World, Harder Goal

KB:

$\text{On}(\text{A}, \text{Table}, \text{S}_0)$
 $\text{On}(\text{B}, \text{C}, \text{S}_0)$
 $\text{On}(\text{C}, \text{Table}, \text{S}_0)$
 $\text{Clear}(\text{A}, \text{S}_0)$
 $\text{Clear}(\text{B}, \text{S}_0)$

and axioms about actions, etc.

Goal:

$\exists s' \text{On}(\text{A}, \text{B}, s') \wedge \text{On}(\text{B}, \text{C}, s')$

(Intuitively, really not harder: B already on C, and we just showed how to make A on B.)

Informatics 2D

With Goal $\text{On}(\text{A}, \text{B}, s') \wedge \text{On}(\text{B}, \text{C}, s')$

• Suppose we try to prove the first subgoal, $\text{On}(\text{A}, \text{B}, s')$.

– Use same axiom

$\forall x, y, s. \text{Clear}(x, s) \wedge \text{Clear}(y, s)$
 $\Rightarrow \text{On}(x, y, \text{Result}(\text{Move}(x, y), s))$

– Again, by chaining, we can conclude

$\text{On}(\text{A}, \text{B}, \text{Result}(\text{Move}(\text{A}, \text{B}), \text{S}_0))$.

– Abbreviating $\text{Result}(\text{Move}(\text{A}, \text{B}), \text{S}_0)$ as S_1 , we have $\text{On}(\text{A}, \text{B}, \text{S}_1)$.

• Substituting for s' in our other subgoal makes that $\text{On}(\text{B}, \text{C}, \text{S}_1)$. If this is true, we're done.

• But we have *no reason to believe this is true!*

• Sure, $\text{On}(\text{B}, \text{C}, \text{S}_0)$, but how does the planner know this is still true, i.e., $\text{On}(\text{B}, \text{C}, \text{S}_1)$?

• In fact, it doesn't, so it fails to find an answer!

Informatics 2D

The Frame Problem

• We have failed to express the fact that everything that *isn't changed by an action stays the same*.

• Can fix by adding *frame axioms*. E.g.:

$\forall x, y, z, s.$

$\text{Clear}(x, s) \Rightarrow \text{Clear}(x, \text{Result}(\text{Paint}(x, y), s))$

...

• There are *lots* of these!

• Is this a big problem?

Informatics 2D

Better Frame Axioms

• Can fix with neater formulation:

$\forall x, y, s, a.$

$\text{On}(x, y, s) \wedge (\forall z. a = \text{Move}(x, z) \Rightarrow y = z)$
 $\Rightarrow \text{On}(x, y, \text{Result}(a, s))$

• Can combine with effect axioms to get *successor-state axioms*:

$\forall x, y, s, a.$

$\text{On}(x, y, \text{Result}(a, s)) \Leftrightarrow$

$\text{On}(x, y, s) \wedge (\forall z. a = \text{Move}(x, z) \Rightarrow y = z)$

$\vee (\text{Clear}(x, s) \wedge \text{Clear}(y, s) \wedge a = \text{Move}(x, y))$

Informatics 2D

How Does This Help Our Example?

- We want to prove $\text{On}(\mathbf{B}, \mathbf{C}, \text{Result}(\text{Move}(\mathbf{A}, \mathbf{B}), \mathbf{S}_0))$ given that $\text{On}(\mathbf{B}, \mathbf{C}, \mathbf{S}_0)$
- Axiom says $\forall x, y, s, a. \text{On}(x, y, \text{Result}(a, s)) \Leftrightarrow \text{On}(x, y, s) \wedge (\forall z. a = \text{Move}(x, z) \Rightarrow y = z) \vee (\text{Clear}(x, s) \wedge \text{Clear}(y, s) \wedge a = \text{Move}(x, y))$
- So need to show $\text{On}(\mathbf{B}, \mathbf{C}, \mathbf{S}_0) \wedge (\forall z. \text{Move}(\mathbf{A}, \mathbf{B}) = \text{Move}(\mathbf{B}, z) \Rightarrow \mathbf{C} = z)$ is true, which is easy
 - The first conjunct is in the KB.
 - The second one is true since actions are the same only if they have the same name and involve the exact same objects i.e.

$A(x_1, \dots, x_m) = A(y_1, \dots, y_m)$ iff $x_1 = y_1 \wedge \dots \wedge x_m = y_m$
 so $\text{Move}(\mathbf{A}, \mathbf{B}) = \text{Move}(\mathbf{B}, z)$ is false.

Note: Another assumption in KB: $A(x_1, \dots, x_m) \neq B(y_1, \dots, y_n)$

These are known as Unique Action Axioms

Informatics 2D

For Refutation Theorem Proving: (Dual) Skolemisation

- Suppose $\forall x. \exists y. G(x, y)$ is goal in resolution refutation.
- So, we need to **negate** the goal:

$$\neg \forall x. \exists y. G(x, y) \equiv \exists x. \forall y. \neg G(x, y)$$

- Then skolemise (i.e drop existential quantifier):

$$\neg G(X_0, y)$$

- Intuition:
 - y is to be unified to construct *witness*.
 - X_0 must **not** be instantiated.
- Similar story for GMP, but goal **not** negated, i.e. $G(X_0, y)$, for some y, is used as the goal.

Informatics 2D

KB and Axioms as Clauses

Constants: A, B, C, S0
 Variables: a, x, y, s

Initial State

$\text{On}(\mathbf{A}, \text{Table}, \mathbf{S}_0)$
 $\text{On}(\mathbf{B}, \mathbf{C}, \mathbf{S}_0)$
 $\text{On}(\mathbf{C}, \text{Table}, \mathbf{S}_0)$
 $\text{Clear}(\mathbf{A}, \mathbf{S}_0)$
 $\text{Clear}(\mathbf{B}, \mathbf{S}_0)$

Goal

$\neg \text{On}(\mathbf{A}, \mathbf{B}, s') \vee \neg \text{On}(\mathbf{B}, \mathbf{C}, s')$

Effect Axiom

$\neg \text{Clear}(x, s) \vee \neg \text{Clear}(y, s) \vee \text{On}(x, y, \text{Result}(\text{Move}(x, y), s))$

Frame Axioms

$\neg \text{On}(x, y, s) \vee a = \text{Move}(x, Z(x, y, z, s, a)) \vee \text{On}(x, y, \text{Result}(a, s))$
 $\neg \text{On}(x, y, s) \vee \neg y = Z(x, y, z, s, a) \vee \text{On}(x, y, \text{Result}(a, s))$

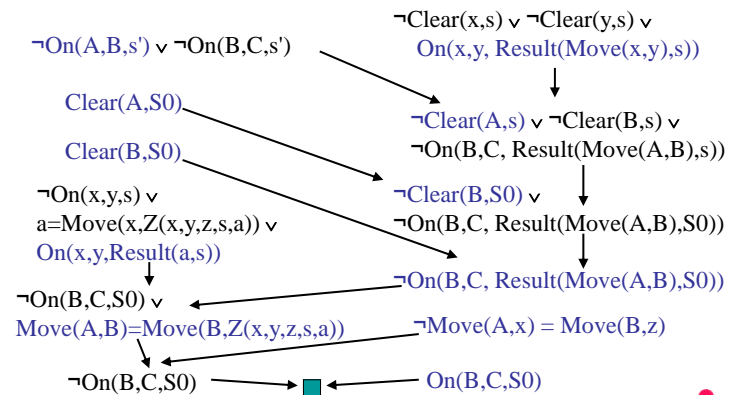

Skolem function

Unique Action Axioms: $\neg \text{Move}(\mathbf{A}, \mathbf{B}) = \text{Move}(\mathbf{B}, z)$, etc

Unique Name Axiom: disequality for every pair of constants in KB

Informatics 2D

Resolution Refutation

Informatics 2D

Frame problem partially solved

- . This solves the representational part of the frame problem.
- . Still have to compute that everything that was true that wasn't changed is still true. Inefficient (as is general theorem proving).
- . Solution: Special purpose representations, special purpose algorithms, called *Planners*.

Informatics 2D

Summary

- Planning
- Situations
- Frame problem
