1

Haskell

- Purely functional! : “Everything is a function”
- Main topics:
 - Recursion
 - Currying
 - Higher-order functions
 - List processing functions such as map, filter, foldl, sortBy, etc
 - The Maybe monad
- More on Haskell: <http://www.haskell.org/haskellwiki/Haskell>

Informatics 2D

2

Types

- Unlike other programming languages like Java, Haskell has type inference.
- However, type declarations ensures that you are specific about the input arguments of your function and the output values.
- Example:

```
next :: Trace -> [Trace]
```

- The **next** function takes an argument of type **Trace** and returns a list of *Traces*

Informatics 2D

3

Type Synonyms

```
type Trace = [(Int,Int)]
```

```
type Game = [Int]
```

- The type Trace is a synonym for a list of (Int, Int) tuples.
- For code clarity.

Informatics 2D

4

Recursion

- Important role in Haskell.
- Function is recursive when one part of its definition includes the function itself again.
- Always have a termination condition to avoid infinite loop.

```
length :: [a] -> Int
length [] = 0
length (x:xs) = 1 + length xs
```

Informatics 2D

5

Higher-Order Functions

- Functions are just like any other value in Haskell.
- Functions can take functions as parameters and also return functions.

```
map :: (a -> b) -> [a] -> [b]
map _ [] = []
map f ( x: xs ) = f x : map f xs
```

- Map takes a function and list and applies that function to every element in the list.

Informatics 2D

7

Currying

- The process of creating intermediate functions when feeding arguments into a complex function.
- Note: all functions in Haskell really only take one argument
- Example:
2 * 3 in Haskell:
 - (*) function takes first argument 2, and return an intermediate function (2*)
 - The new function (2*) takes one argument,3, and completes the multiplication
- Applying only one parameter to a function that takes two parameters returns a function that takes one parameter

Informatics 2D

6

List Processing Functions

(map, filter, foldl, etc.)

- **map**: takes a function and list and applies that function to every element in the list.
$$\text{map} :: (a \rightarrow b) \rightarrow [a] \rightarrow [b]$$
- **filter**: takes a predicate (function that returns true or false) and list and then returns the list of all elements that satisfy the predicate.
$$\text{filter} :: (a \rightarrow \text{Bool}) \rightarrow [a] \rightarrow [a]$$
- **foldl**: takes a binary function, an accumulator and a list. It 'folds' up the items in the list and return a single value.
$$\text{foldl} :: (a \rightarrow b \rightarrow a) \rightarrow a \rightarrow [b] \rightarrow a$$

Informatics 2D

8

List Comprehension

- Build more specific sets out of general sets.
- Example: to create a list of integers that are multiples of 2 and greater than 20:

```
[x*2 | x <- [1..25] , x*2 >= 20]
```

Informatics 2D

9

Maybe Monad

- The Maybe monad represents computations which might "go wrong" by not returning a value.
- If a value is returned, it uses **Just a**, where a is the type of the value.
- If no value is available, it returns **Nothing**.

• Example:

```
safeDiv :: Double -> Double -> Maybe Double
safeDiv x y
  | y == 0 = Nothing
  | otherwise = Just (x/y)
```

Informatics 2D

10

Coursework Overview

- Trace type for search problems
- ```
type Trace = [(Int,Int)]
```

- Example :
- A path from (1,1) to (4,2)

```
[(1,1), (1,2), (2,2), (3,2), (4,2)]
```

|    | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
|----|---|---|---|---|---|---|---|---|---|----|
| 1  | x | x |   |   |   |   |   |   |   |    |
| 2  |   | x |   |   |   |   |   |   |   |    |
| 3  |   | x |   |   |   |   |   |   |   |    |
| 4  |   | x |   |   |   |   |   |   |   |    |
| 5  |   |   |   |   |   |   |   |   |   |    |
| 6  |   |   |   |   |   |   |   |   |   |    |
| 7  |   |   |   |   |   |   |   |   |   |    |
| 8  |   |   |   |   |   |   |   |   |   |    |
| 9  |   |   |   |   |   |   |   |   |   |    |
| 10 |   |   |   |   |   |   |   |   |   |    |

Informatics 2D

## Successor Function

- The next function returns the possible continuations of the path
- ```
next :: Trace -> [Trace]
```

- Example :
 - Suppose we start from are at (4,2)
 - Possible continuations generated by next
- ```
[[(1,1), (1,2), (2,2), (3,2), (4,2), (4,1)],
 [(1,1), (1,2), (2,2), (3,2), (4,2), (3,2)],
 [(1,1), (1,2), (2,2), (3,2), (4,2), (4,3)],
 [(1,1), (1,2), (2,2), (3,2), (4,2), (5,2)]]
```

|    | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
|----|---|---|---|---|---|---|---|---|---|----|
| 1  |   |   |   |   |   |   |   |   |   |    |
| 2  |   |   |   |   |   |   |   |   |   |    |
| 3  |   |   |   |   |   |   |   |   |   |    |
| 4  |   | x |   |   |   |   |   |   |   |    |
| 5  |   |   |   |   |   |   |   |   |   |    |
| 6  |   |   |   |   |   |   |   |   |   |    |
| 7  |   |   |   |   |   |   |   |   |   |    |
| 8  |   |   |   |   |   |   |   |   |   |    |
| 9  |   |   |   |   |   |   |   |   |   |    |
| 10 |   |   |   |   |   |   |   |   |   |    |

Informatics 2D

## Consistency with representation

- Be consistent with your representation of Traces in Haskell

`[(1,1),(1,2),(2,2),(3,2),(4,2)]`

`[(4,2),(3,2),(2,2),(1,2),(1,1)]`

- Both are ok, provided you are consistent with the head and tail of your list.
- Same applies to [Trace]

Informatics 2D

13

## Game (Tic-Tac-Toe) Representation

- Game represented as a list of Integers  
`type Game = [Int]`
- A new game will be represented as  
`[-1,-1,-1,-1,-1,-1,-1,-1,-1]`
- Max player is represented by a **1** in the list.
- Min player is represented as **0** in the list.
- An unplayed cell is represented as **-1**
- Types for Cell and Player  
`type Player = Int`  
`type Cell = (Int,Int)`

|   |   |   |
|---|---|---|
| X | O | X |
| O | X | O |
| O | O | X |

Informatics 2D

15

## Higher-Order Functions in Coursework

Example:

```
bestFirstSearch :: (Trace -> Bool) -> (Trace -> [Trace]) ->
((Int,Int) -> Int) -> [Trace] -> Maybe Trace
```

- **(Trace → Bool)** is the type of the goal function (same as uninformed search).
- **(Trace → [Trace])** is the type of the next function (same as uninformed search).
- **((Int,Int) → Int)** is the type of the heuristic function, which defines at least an ordering on the nodes in the search agenda.
- **[Trace]** is the search agenda (same as uninformed search).
- **Maybe Trace** is the value the function returns (same as uninformed search).

Informatics 2D

14

## Game Representation Examples

- New Game: `[-1, -1, -1, -1, -1, -1, -1, -1, -1]`

|  |  |  |
|--|--|--|
|  |  |  |
|  |  |  |
|  |  |  |

- Min Move: `[-1, -1, -1, -1, 0, -1, -1, -1, -1]`

|  |   |  |
|--|---|--|
|  |   |  |
|  | O |  |
|  |   |  |

- Max Move: `[ 1, -1, -1, -1, 0, -1, -1, -1, -1]`

|   |   |  |
|---|---|--|
| X |   |  |
|   | O |  |
|   |   |  |

Informatics 2D

16

## Lines in Game

---

- The Line type represents any of the lines on the game board: rows, columns and diagonals.

**type Line = [Int]**

- Examples of Lines for the game state given:
- Row 1: [1, 0, 1]      Row 3: [0, 0, 1]
- Column 1: [1, 0, 0]      Diagonal 1: [1, 1, 1]

|   |   |   |
|---|---|---|
| X | O | X |
| O | X | O |
| O | O | X |

- To get all lines for a game state, use function:  
**getLines :: Game -> [Line]**

Informatics 2D

17

## Other useful functions

---

- maxPlayer function checks if the given player is max, and returns a Boolean.  
**maxPlayer :: Player -> Bool**
- switch function alternates between players.  
**switch :: Player -> Player**
- terminal function checks if the game argument is in a terminal state.  
**terminal :: Game -> Bool**
- isMoveValid checks if a move made in a given game state is a valid one for a given player.  
**isMoveValid :: Game -> Player -> Cell -> Bool**
- playMove makes a move to a cell and returns the new game state. This function is called for human player moves.  
**playMove :: Game -> Player -> Cell -> Game**
- moves function returns a list of possible moves/successor states that a player can make given a game state.  
**moves :: Game -> Player -> [Game]**
- checkWin function checks if the game state is a win for the player argument.  
**checkWin :: Game -> Player -> Bool**
