# Vanishing and exploding gradients

- BPTT involves taking the product of many gradients (as in a very deep network)

   this can lead to vanishing (component gradients less than 1) or exploding (greater than 1) gradients
- This can prevent effective training
- Modified optimisation algorithms
  - RMSProp (and similar algorithms) normalise the gradient for each weight by average of it magnitude, with a learning rate for each weight
  - Hessian-free an approximation to second-order approaches which use curvature information
- Modified hidden unit transfer functions:

Long short term memory (LSTM)

- Linear self-recurrence for each hidden unit (long-term memory)
- Gates dynamic weights which are a function of their inputs

# LSTM – Input Gate

- Internal recurrent state ("cell") c(t) combines previous state c(t-1) and LSTM input g(t)
- Gates weights dependent on the current input and the previous state
- Input gate: controls how much input to the unit g(t) is written to the internal state c(t)

イロト イヨト イヨト

# LSTM – Forget Gate

- Internal recurrent state ("cell") c(t) combines previous state c(t-1) and LSTM input g(t)
- Gates weights dependent on the current input and the previous state
- Input gate: controls how much input to the unit g(t) is written to the internal state c(t)
- Forget gate: controls how much of the previous internal state c(t-1) is written to the internal state c(t)
  - Input and forget gates together allow the network to control what information is stored and overwritten at each step

## LSTM – Input and Forget Gates

$$\mathbf{I}(t) = \sigma \left( \mathbf{W}_{ik} \mathbf{x}(t) + \mathbf{W}_{ih} \mathbf{h}(t-1) + \mathbf{b}_i \right)$$
  
$$\mathbf{F}(t) = \sigma \left( \mathbf{W}_{fx} \mathbf{x}(t) + \mathbf{W}_{fh} \mathbf{h}(t-1) + \mathbf{b}_f \right)$$

$$\begin{aligned} \mathbf{g}(t) &= \mathbf{W}_{h \times} \mathbf{x}(t) + \mathbf{W}_{h h} \mathbf{h}(t-1) + \mathbf{b}_{h} \\ \mathbf{c}(t) &= \mathbf{F}(t) \circ \mathbf{c}(t-1) + \mathbf{I}(t) \circ \mathbf{g}(t) \end{aligned}$$

 $\sigma$  is the sigmoid function  $\circ$  is element-wise vector multiply

イロト イポト イヨト イヨト

# LSTM – Input and Forget Gates

# LSTM – Output Gate

• Output gate: controls how much of each unit's activation is output by the hidden state – it allows the LSTM cell to keep information that is not relevant at the current time, but may be relevant later

イロト イポト イヨト イヨト

-

# LSTM – Output Gate

$$\begin{split} \mathbf{O}(t) &= \sigma \left( \mathbf{W}_{ox} \mathbf{x}(t) + \mathbf{W}_{oh} \mathbf{h}(t-1) + \mathbf{b}_{o} \right) \\ \mathbf{h}(t) &= \mathbf{O}(t) \circ \tanh \left( \mathbf{c}(t) \right) \end{split}$$

◆□ > ◆□ > ◆臣 > ◆臣 > ○臣 の < @

# LSTM equations

$$I(t) = \sigma (\mathbf{W}_{ix}\mathbf{x}(t) + \mathbf{W}_{ih}\mathbf{h}(t-1) + \mathbf{b}_i)$$

$$F(t) = \sigma (\mathbf{W}_{fx}\mathbf{x}(t) + \mathbf{W}_{fh}\mathbf{h}t - 1) + \mathbf{b}_f)$$

$$O(t) = \sigma (\mathbf{W}_{ox}\mathbf{x}(t) + \mathbf{W}_{oh}\mathbf{h}(t-1) + \mathbf{b}_o)$$

$$g(t) = \mathbf{W}_{hx}\mathbf{x}(t) + \mathbf{W}_{hh}\mathbf{h}(t-1) + \mathbf{b}_h$$

$$c(t) = F(t) \circ c(t-1) + I(t) \circ g(t)$$

$$h(t) = O(t) \circ \tanh(c(t))$$
