Semantic Web Systems

Ontologies

Jacques Fleuriot

School of Informatics

In the previous lecture

- What is the Semantic Web?
 - Web of machine-readable data
- Aims of the Semantic Web
 - Automated query-answering
 - Automated use of data

In this lecture

- What is an ontology?
- Frame-based approaches
- Folksonomy

What is an ontology?

What is an ontology? (1)

Originally: a definitive account of what exists
(derived from metaphysics).

Therefore, we can create a single ontology that
describes the world – maybe dividing into smaller
sub-ontologies as necessary.

But this is completely misconceived!

Same worldview?

A single ontology?

- A notion of relevant knowledge is highly subjective
 - Which parts of the world it is important to talk about
 - How to segregate and organise the world
 - What terms to use
- Ontologies are designed by individuals: central control is impossible and undesirable

...or several ontologies?

- But ontological differences are desirable and essential:
 - Freedom of expression
 - Ability to adapt to task
 - Changing environment
- Even direct contradictions can be desirable
- Is a tomato a fruit or a vegetable?
- The crucial task is managing these differences

Ontology definitions

“an explicit specification of a conceptualisation”

Gruber, 1993

“a formal, explicit specification of a shared conceptualisation”

Studer et al, 1998

“an explicit representation of a shared understanding of the important concepts in some domain of interest”

Kalfoglou, 2002

“a set of types, properties and relationships”

Wikipedia, 2010

But what does this mean?

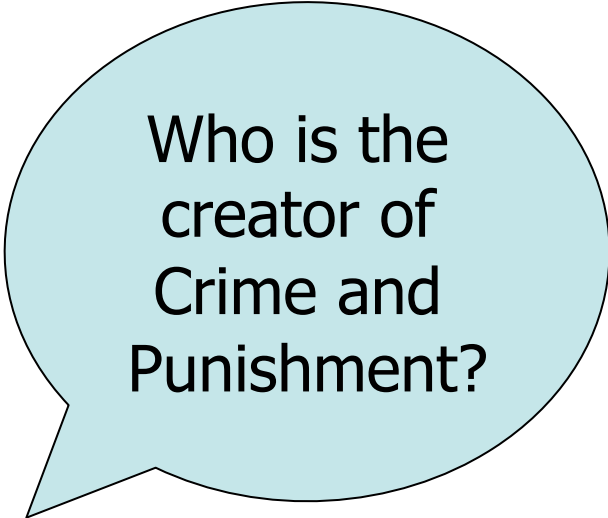

What is an ontology? (2)

- Essentially: a way of encoding domain knowledge
- But there are many different choices as to how this is done.
- The word *ontology* is over-loaded: it means different things to different people.
- Ontologies are also sometimes referred to as **vocabularies**. A vocabulary is typically a light-weight ontology.

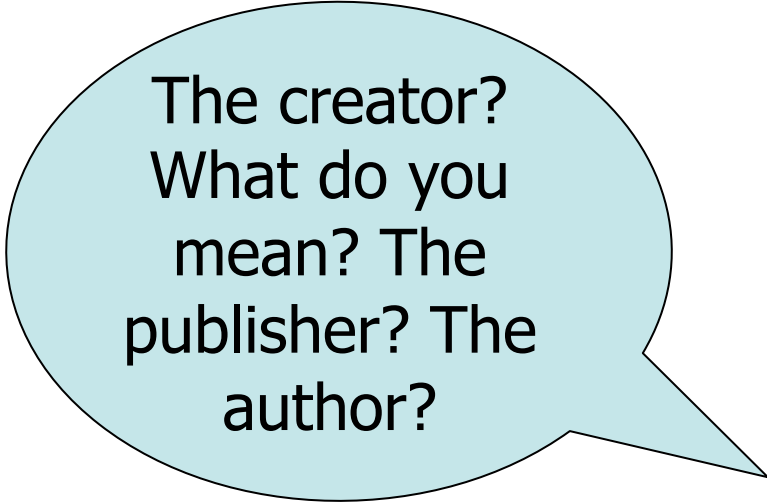

Why Semantic Web ontologies?

- Data integration

Who is the creator of Crime and Punishment?

The creator?
What do you mean? The publisher? The author?

Why Semantic Web ontologies?

- Data integration
- Inference

William Burnes is the
father of Robert Burns.
...
...

Father is a subclass of
Parent.
...
...

William Burnes is the
parent of Robert Burns.

Why Semantic Web ontologies?

- Data integration
- Inference

- Automated query-answering
- Automated use of data

Example ontologies

	Language	Swoogle hits	Revised
Dublin Core	RDF	1,364,337	28 October 2006
FOAF	OWL DL	1,194,871	27 July 2005
TrackBack	RDF	502,401	
MetaVocab	RDF	441,790	16 February 2002
Basic Geo Vocabulary	RDF Schema	248,130	1 February 2006
BIO	RDF	220,228	5 March 2004
RSS 1.0	RDF Schema	201,786	6 December 2000
VCard RDF	RDF	181,962	22 February 2001

Pedagogical diagnosis	OWL DL	1	1 April 2012
DILIGENT Argumentation Ontology	OWL 2	1	13 September 2006
OpenGUID	RDF Schema	1	24 September 2008
Provenance Vocabulary	OWL DL	1	25 August 2009

Representation and Reasoning

- Long history of attempts in Artificial Intelligence to develop knowledge-based systems.

Given a knowledge base KB, is the sentence A true?

- We can't just look to see if A is contained in KB; typically need to do some **inference**.
- First-order logic can represent pretty much everything, but **intractable** inference seen as a major barrier.

In reality this depends on how complex the ontology is.

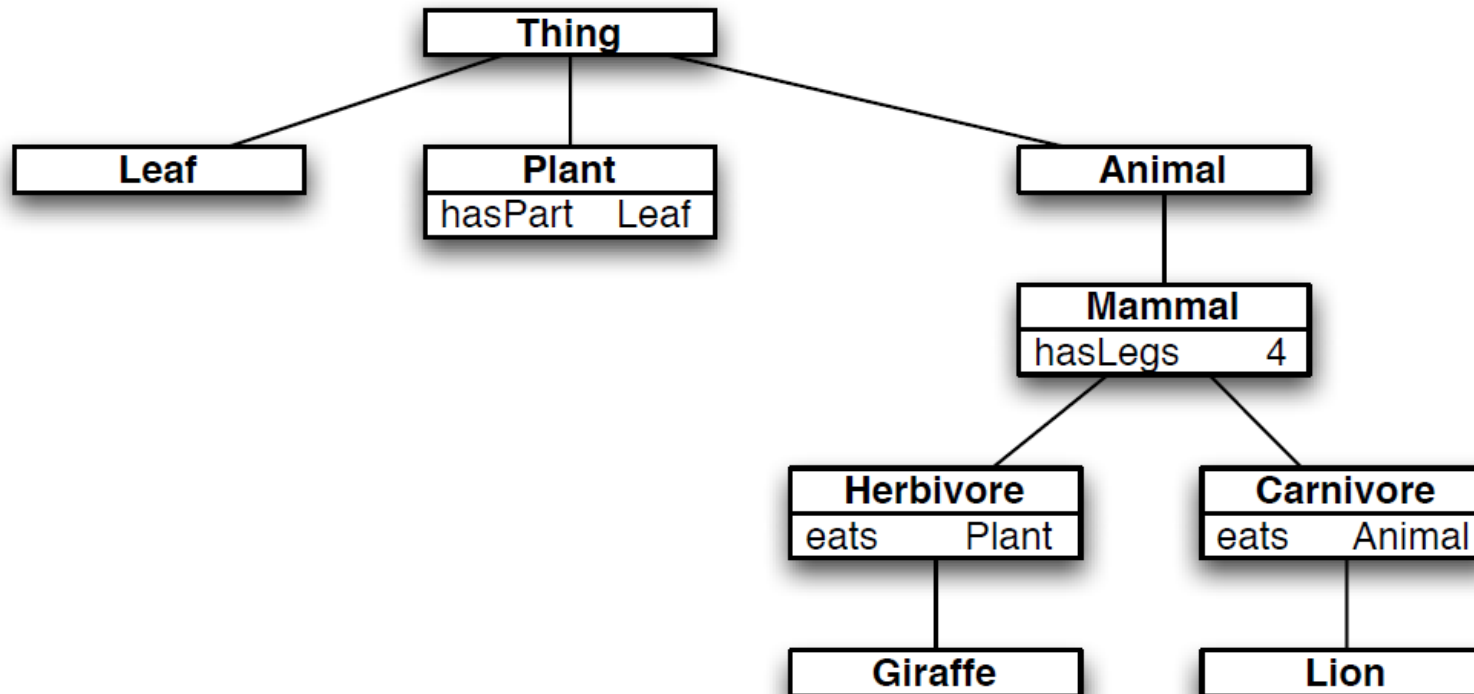

- Much effort devoted to developing alternatives which were seen as more tractable.

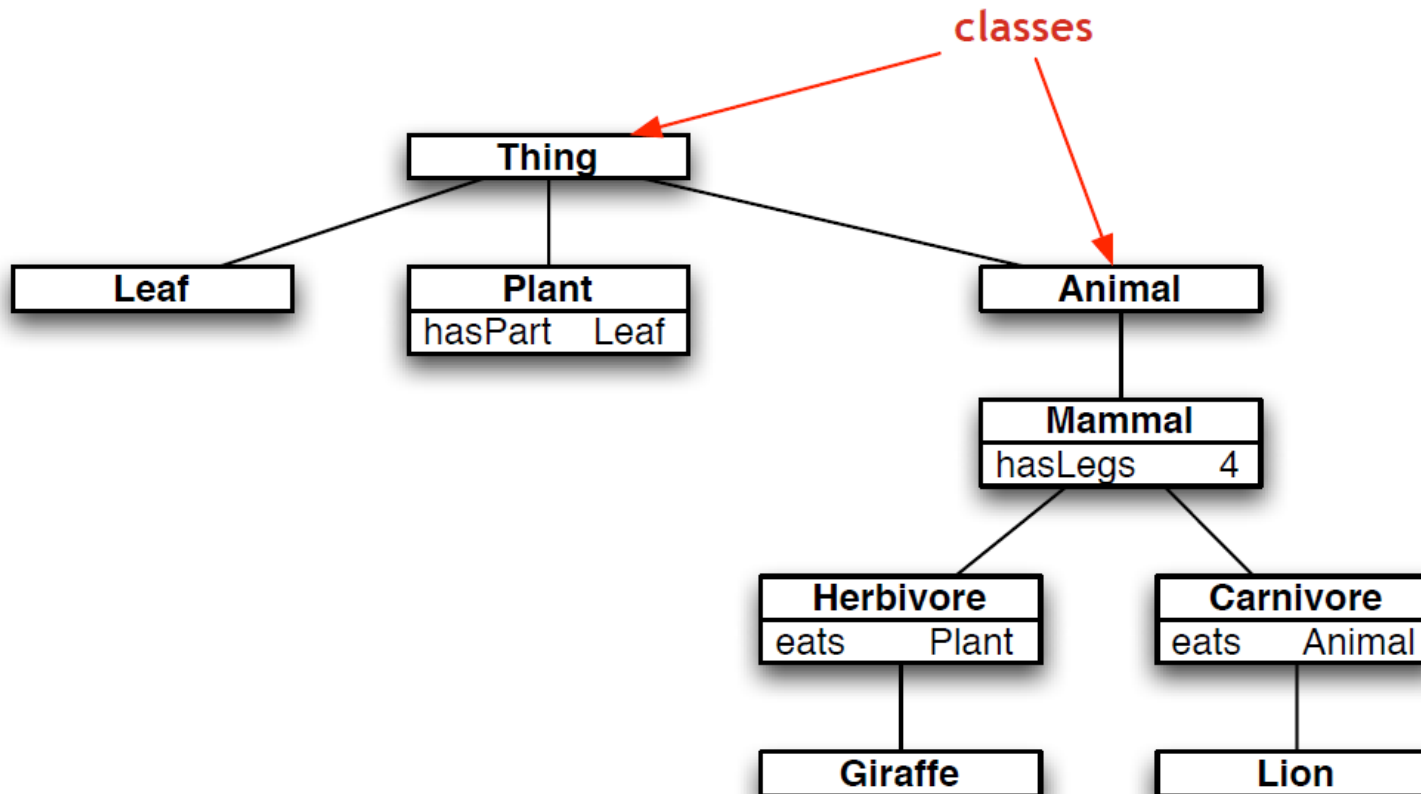

Frame-based approach

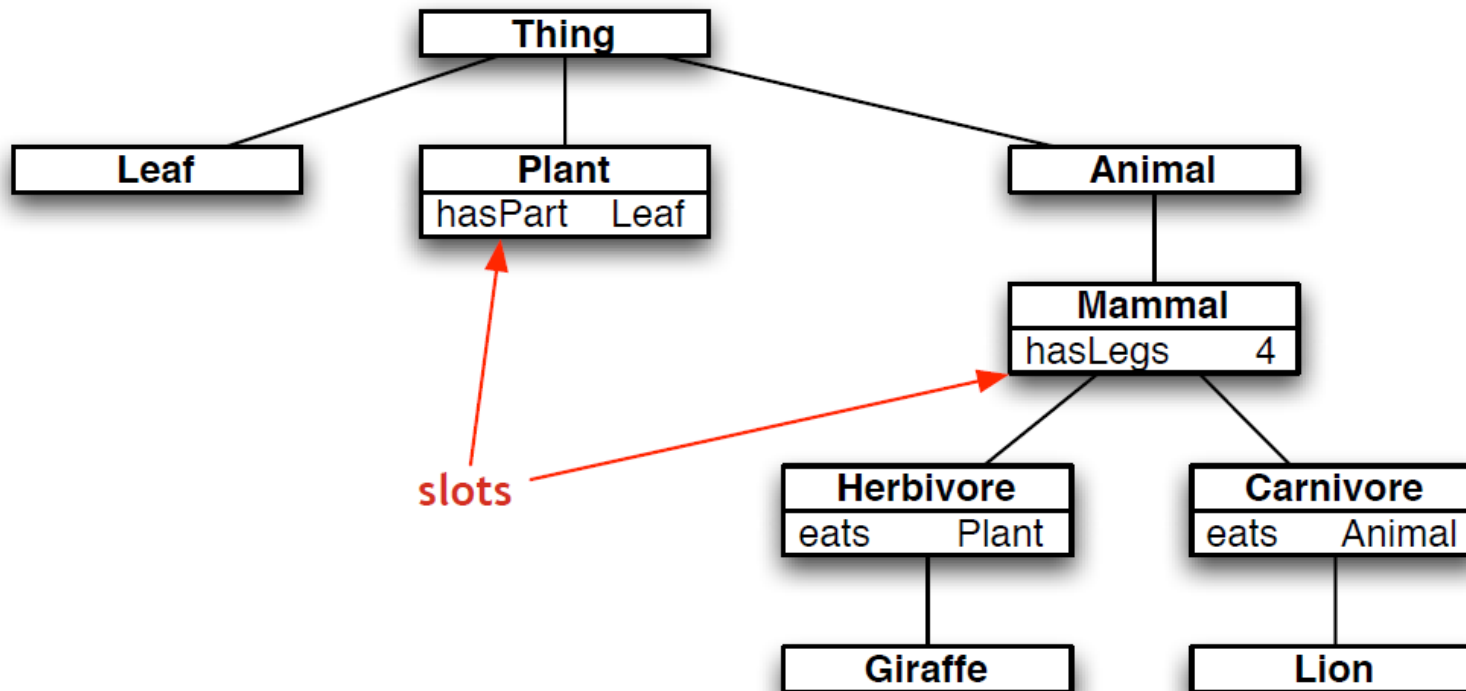

Hierarchies and Frames

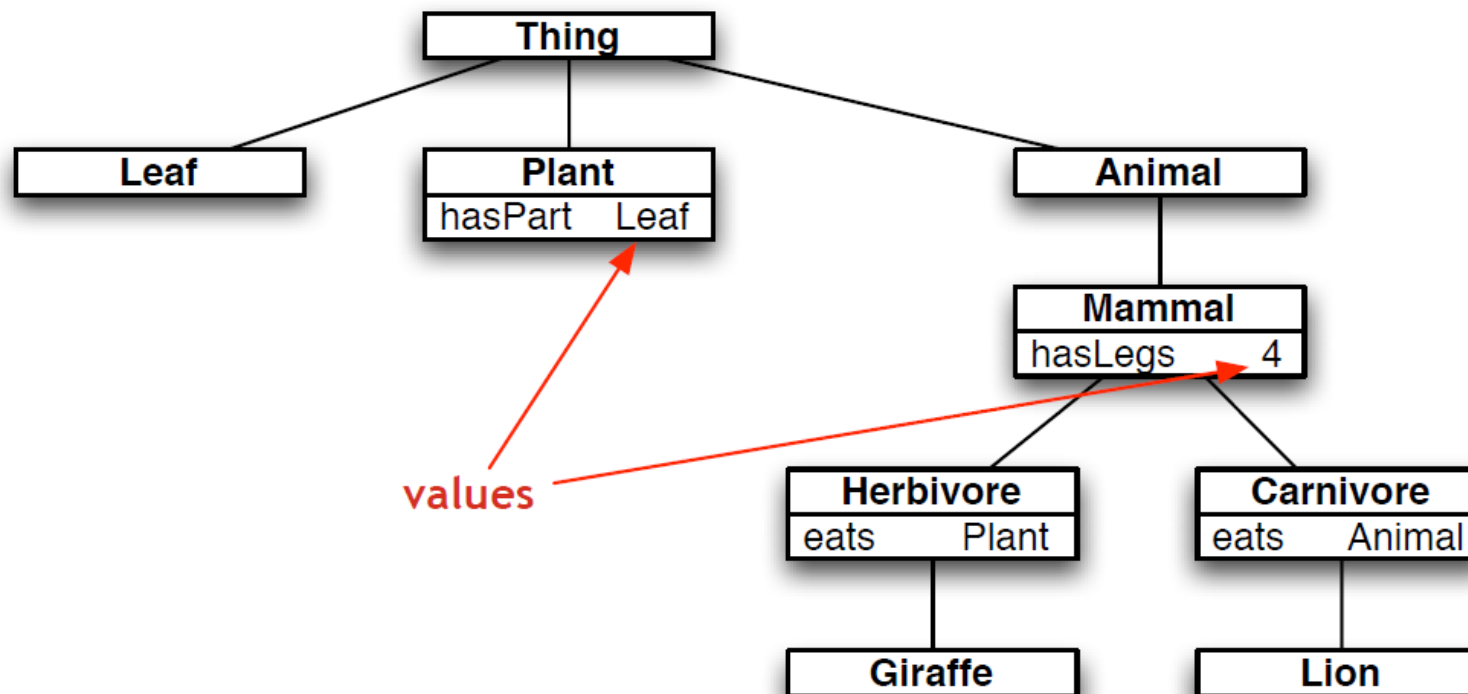

Hierarchies and Frames

Hierarchies and Frames

Hierarchies and Frames

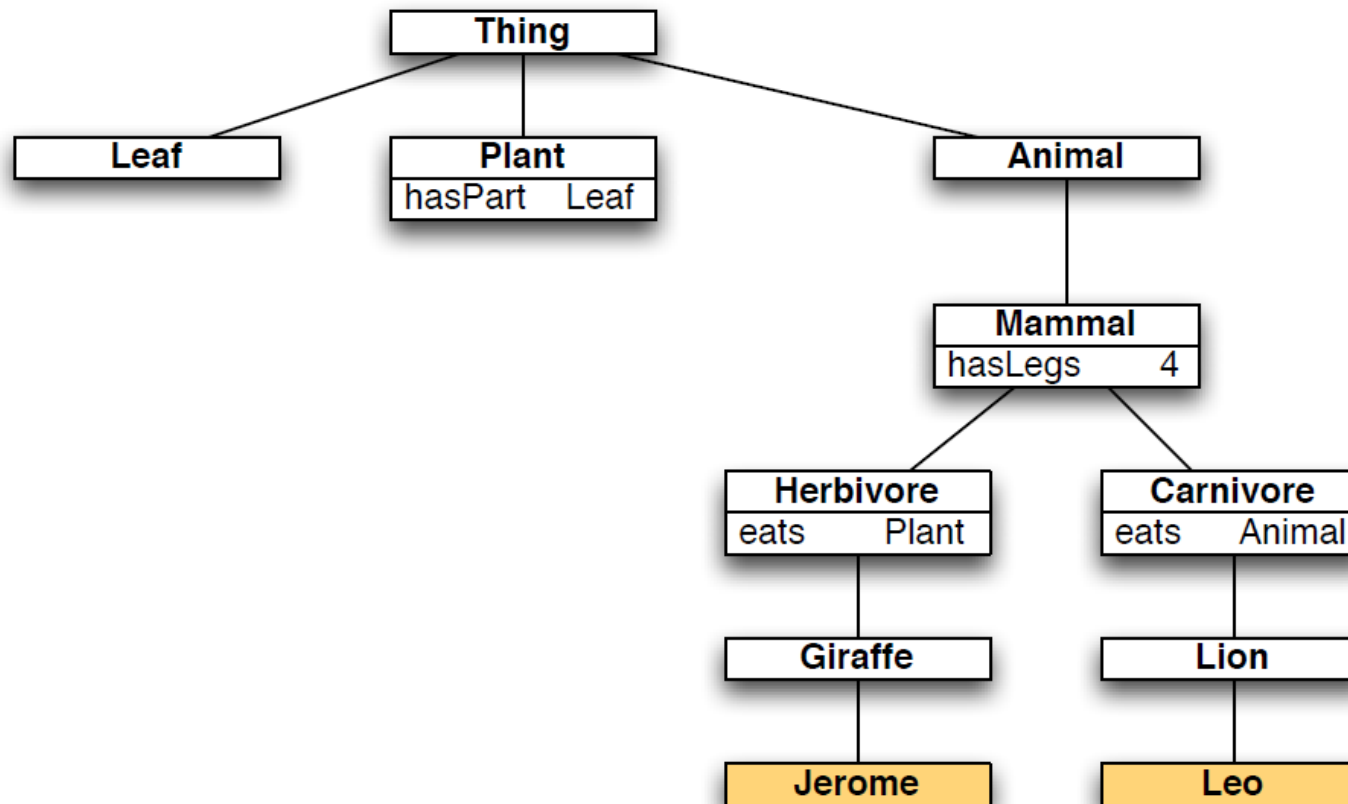

Hierarchies and Frames

- Frames are a way of describing classes or concepts or types
- Usual to think of classes in terms of sets of individuals
- Frames contain **slots** with **values**
- Values can be restricted in various ways:
 - Integer, boolean or literal values
 - Enumerated values
 - Instances of a specified class

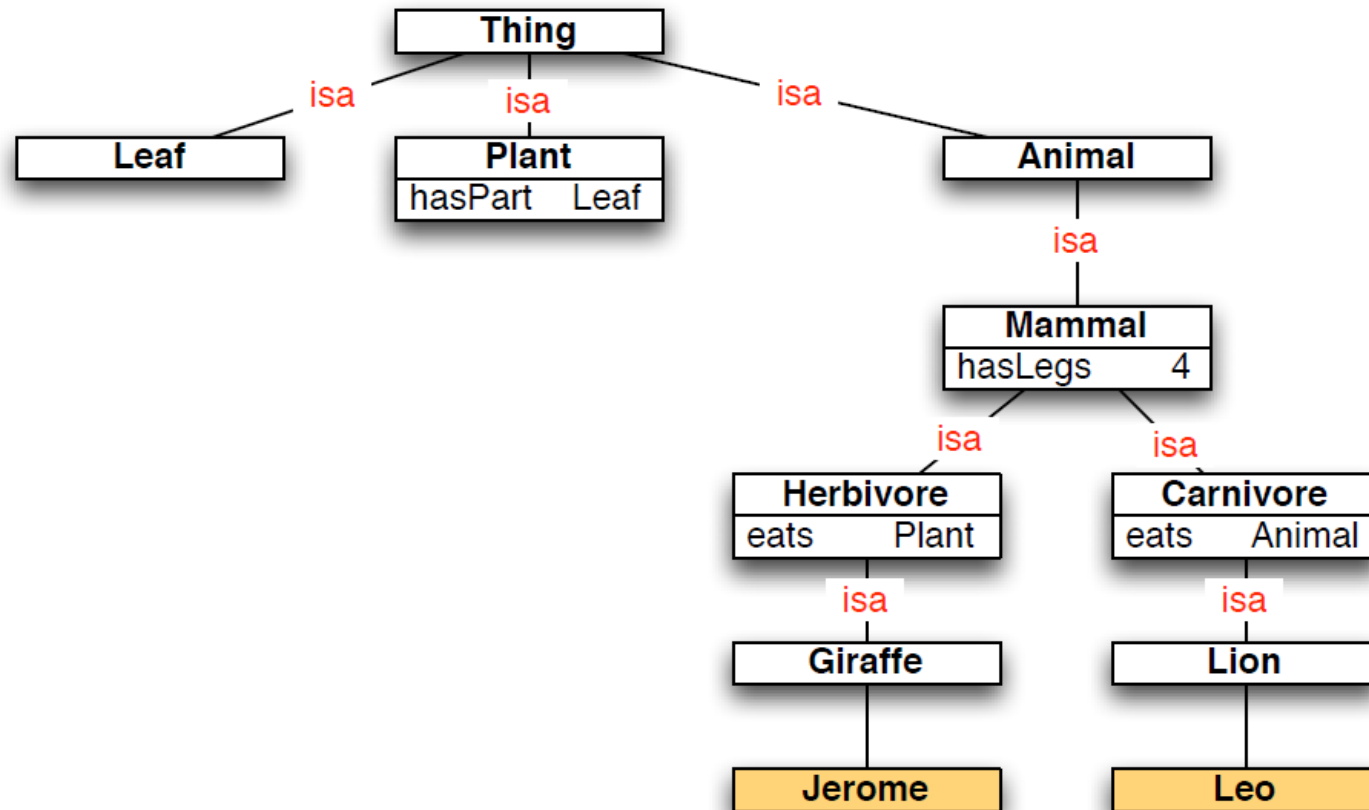

Classes and Individuals

Classes and Individuals

- Ambiguity about nature of the edge in the graph. Reflected in English:
 - A lion **is a** carnivore
 - Jerome **is** a giraffe
- Two different relations/labels:
 - **ISA**: taxonomic — a lion is a kind of carnivore
 - $\text{Lion} \subseteq \text{Carnivore}$ $[\forall x. \text{Lion}(x) \rightarrow \text{Carnivore}(x)]$
 - **IO**: instance-of/membership — Jerome is a member of the class of giraffes
 - $\text{Jerome} \in \text{Giraffe}$ $[\text{Giraffe}(\text{Jerome})]$

Classes and Individuals

Inheritance

How many legs does Jerome have? 4

⇒ Jerome is an instance of Giraffe

⇒ Every instance of Giraffe is an instance of Herbivore

⇒ Every instance of Herbivore is an instance of Mammal

⇒ Mammals have 4 legs

So the attribute of having 4 legs is **inherited** by Giraffe from Mammal

Assertion vs Terminology

- Assertions - simple facts about the world:
 - Joe is married to Sue
 - Bill has a brother with no children
 - Harry's friends are Bill's cousins
- Terminology:
 - *ancestor* is the transitive closure of *parent*
 - *brother* is *sibling* restricted to males
 - *favourite-cousin* is a special type of cousin
- The KRYPTON system (Brachman, Fikes Levesque, 1983) proposed dividing KR system into two main components:
 - **ABox** (assertions)
 - **TBox** (terminological structure)

Folksonomy

Folksonomy

Folksonomy \Leftarrow Folk + Taxonomy

- Folksonomy emerged from growing practise of **ad hoc** tagging and labelling
 - e.g. Delicious, Flickr
 - tagging seemed to help the discovery of related resources
“tagging that works”
- Unlike most formal ontologies, collaborative tagging is not hierarchical or centrally controlled.
- Folksonomy brings agents back into process of constructing meaning.

Folksonomy – Vander Wal (2007)

- Result of personal free tagging of information and objects for one's own retrieval
- Done in a social environment (usually open and shared)
- Value is derived from people using their own vocabulary and adding explicit meaning
- Not so much categorizing, as providing a means to connect items

Folksonomy vs Formal ontology

- Vander Wal: folksonomy is not categorization
- Shirky: folksonomy is a more robust and scalable approach to categorization than formal ontology

Folksonomy vs Formal ontology

	Formal Ontology	Tagging
Domain	Small corpus	Large corpus
	Formal categories	No formal categories
	Stable entities	Unstable entities
	Restricted entities	Unrestricted entities
	Clear edges	No clear edges
Participants	Expert catalogers	Naïve catalogers
	Authoritative sources of judgement	No authority
	Coordinated users	Uncoordinated users
	Expert users	Amateur users

Shirky (2005) 'favourable characteristics'

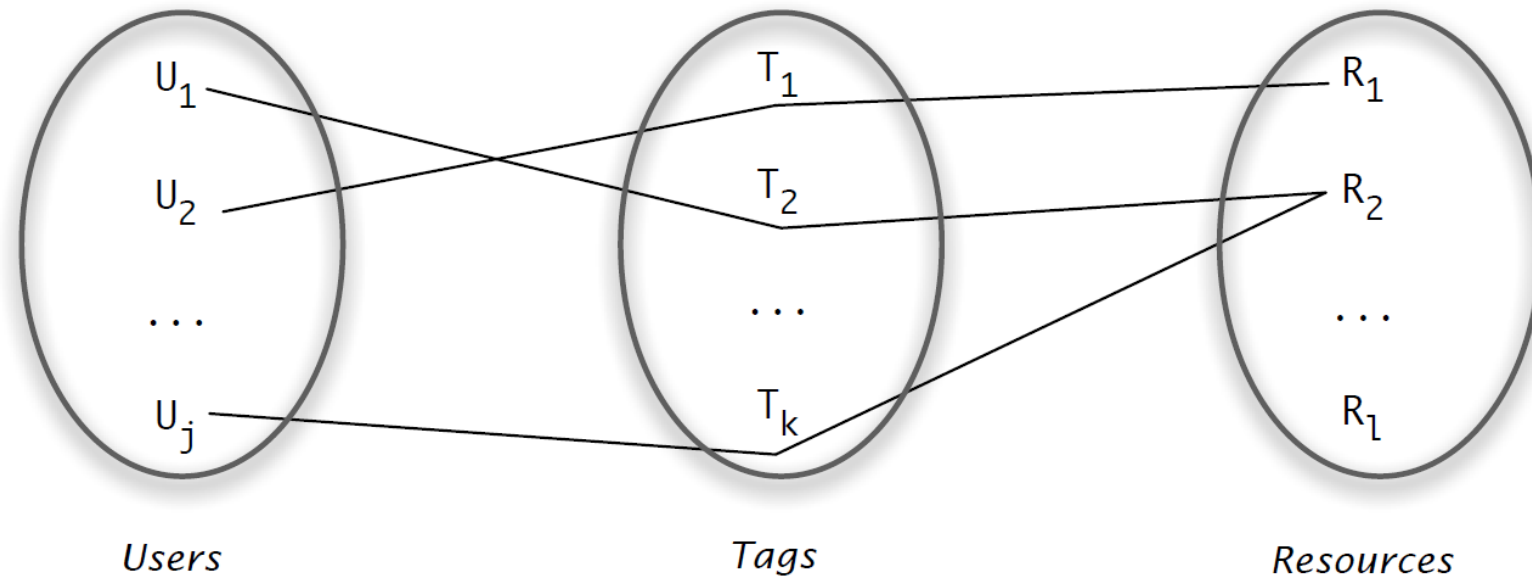

Categorisation vs Classification – Jacob (2004)

Categorisation: division of world of experience into groups that share some perceptible similarity in a given context; context dependence provides categorisation with its power and flexibility

Classification: orderly assignment of each entity to one and only one class within a system of mutually exclusive and non-overlapping classes

- Distinction is not the same as common usage
- But formal ontologies aspire to classification, in the above sense.

Graph Structure of Tagging Systems

A **tagging instance** is a triple (user, tag, resource)

Tag distribution – Halpin et al (2007)

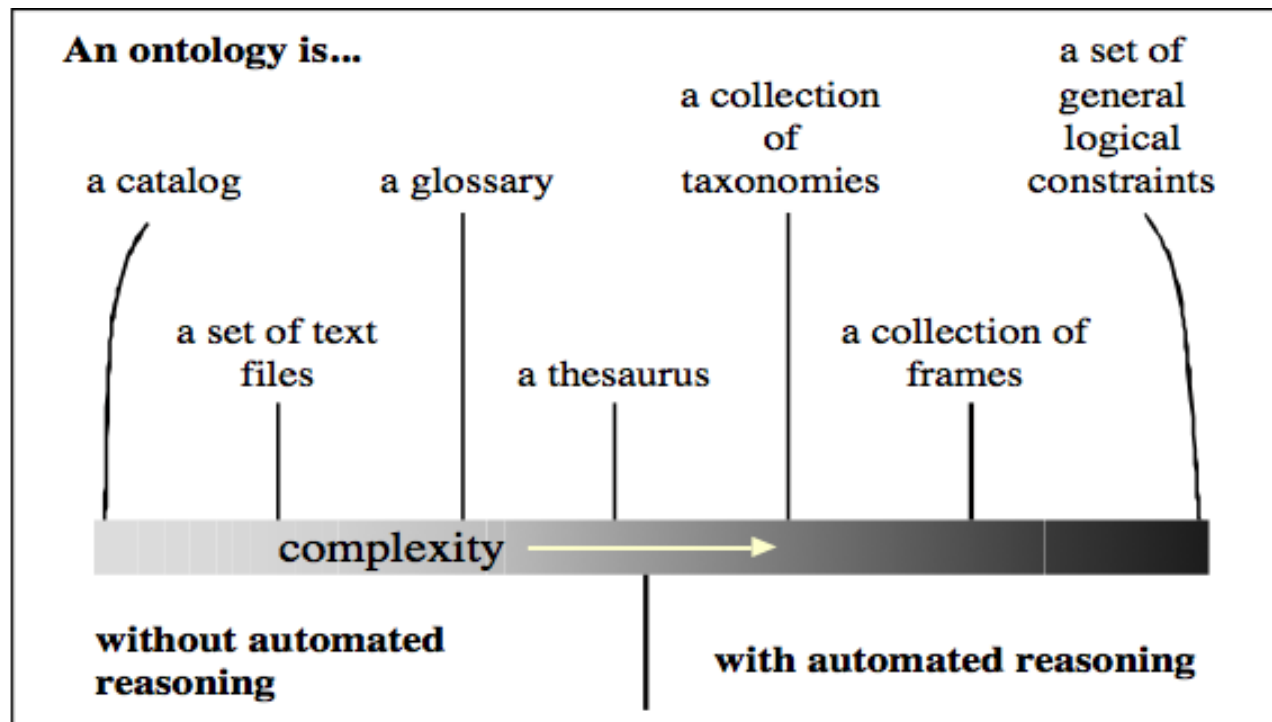

- What is the distribution of tags used to categorise a specific resource (e.g. a Delicious bookmark)?
- Observation: tagging distribution is **stable** in the sense that a small proportion of tags are consistently used to label the resource; and
- New users tend to reinforce tags in the same frequency as the stable distribution.
- Can be viewed as a ‘collective categorization scheme’; i.e. ontology can emerge from collaborative tagging.

Emergent Semantics – Mika (2005)

- **Emergent semantics:** interaction of large number of agents leads to global semantic effects.
- Ontology arises from activity within network as opposed to a fixed, limited contract.
- Goal: more scalable and easily maintainable Semantic Web, incorporating social context.

The bigger picture

Summary

- **Ontology**
 - No consensus on definition
 - A formal, explicit specification of a shared conceptualisation
 - Helps define concepts, relationships and constraints (more on this next week!)
- **Frames**
 - A way of describing classes or concepts or types
 - Contain slots with values
 - ISA vs IO relations
- **Folksonomy**
 - Tagging that works
 - A scalable approach

Task

- Look at the Flickr tags (slide 29)
- Choose a subsection and try to mould it into a small formal ontology
