Neural Networks for Acoustic Modelling 4: LSTM acoustic models; Sequence discriminative training

Steve Renals

Automatic Speech Recognition – ASR Lecture 10 14 February 2019

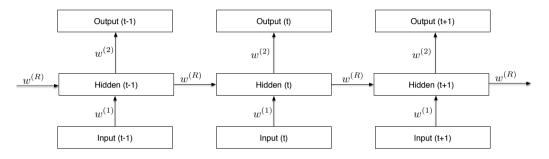

ASR Lecture 10 NNs for Acoustic Modelling 4: LSTMs, Seq Training

ъ

Modelling acoustic context

- DNNs allow the network to model acoustic context by including neighbouring frame in the input layer the output is thus estimating the phone or state probability using that contextual information
- Richer NN models of acoustic context
 - Time-delay neural networks (TDNNs)
 - each layer processes a context window from the previous layer
 - higher hidden layers have a wider receptive field into the input
 - Recurrent neural networks (RNNs)
 - hidden units at time t take input from their value at time t-1
 - these recurrent connections allow the network to learn state
 - Both approaches try to learn invariances in time, and form representations based on compressing the history of observations

イロン 不通 と イヨン イヨン ニヨー

• View an RNN for a sequence of T inputs as a T-layer network with shared weights

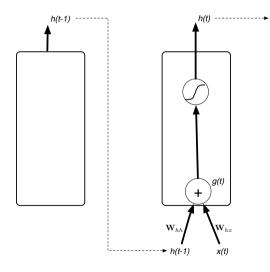

- Train by doing backprop through this unfolded network
- Recurrent hidden units are state units: can keep information through time
 - State units as memory remember things for (potentially) an infinite time
 - State units as information compression compress the history (sequence observed up until now) into a state representation

LSTM Recurrent Networks

ASR Lecture 10 NNs for Acoustic Modelling 4: LSTMs, Seq Training

イロン 不得 とくほど くほとう ほう

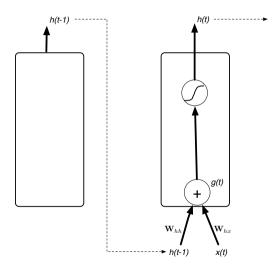

Simple recurrent network unit

$$egin{aligned} \mathbf{g}(t) &= oldsymbol{W}_{hx} oldsymbol{x}(t) + oldsymbol{W}_{hh} oldsymbol{h}(t-1) + oldsymbol{b}_h \ oldsymbol{h}(t) &= anh\left(oldsymbol{g}(t)
ight) \end{aligned}$$

LSTM – Internal recurrent state

Internal recurrent state ("cell")
 c(t) combines previous state
 c(t-1) and LSTM input g(t)

- * ロ * * 個 * * 目 * * 目 * ● * ● * ● *

LSTM – Internal recurrent state

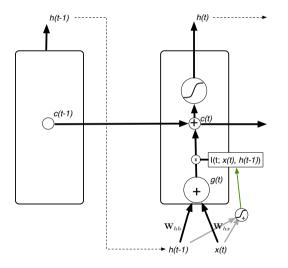

- Internal recurrent state ("cell") c(t) combines previous state c(t-1) and LSTM input g(t)
- Gates weights dependent on the current input and the previous state

ъ

• • = • • = •

LSTM – Input Gate

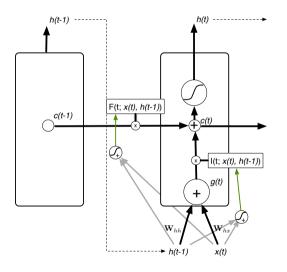

- Internal recurrent state ("cell") c(t) combines previous state c(t-1) and LSTM input g(t)
- Gates weights dependent on the current input and the previous state
- Input gate: controls how much input to the unit g(t) is written to the internal state c(t)

< ロ > < 同 > < 回 > < 回 >

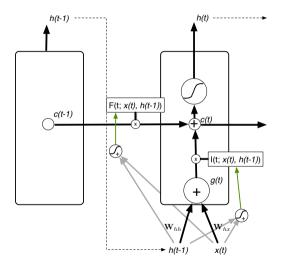

э.

LSTM – Forget Gate

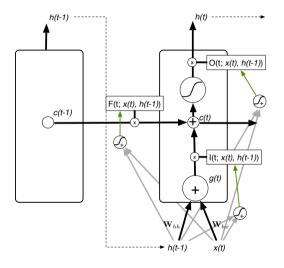

- Internal recurrent state ("cell") c(t) combines previous state c(t-1) and LSTM input g(t)
- Gates weights dependent on the current input and the previous state
- Input gate: controls how much input to the unit g(t) is written to the internal state c(t)
- Forget gate: controls how much of the previous internal state c(t-1) is written to the internal state c(t)
 - Input and forget gates together allow the network to control what information is stored and overwritten at each step

LSTM – Input and Forget Gates

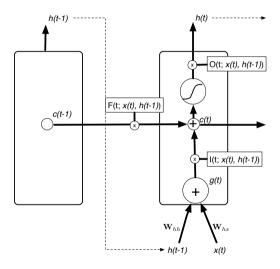

LSTM – Output Gate

• **Output gate**: controls how much of each unit's activation is output by the hidden state – it allows the LSTM cell to keep information that is not relevant at the current time, but may be relevant later

Deep Bidirectional LSTM

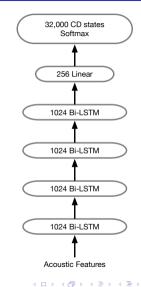

ASR Lecture 10 NNs for Acoustic Modelling 4: LSTMs, Seq Training

・ロト・西ト・ヨト・ヨト・ 日・ のへぐ

Example: Deep Bidirectional LSTM Acoustic Model (Switchboard)

- LSTM has 4-6 bidirectional layers with 1024 cells/layer (512 each direction)
- 256 unit linear bottleneck layer
- 32k context-dependent state outputs
- Input features
 - 40-dimension linearly transformed MFCCs (plus ivector)
 - 64-dimension log mel filter bank features (plus first and second derivatives)
 - concatenation of MFCC and FBANK features
- Training: 14 passes frame-level cross-entropy training, 1 pass sequence training (2 weeks on a K80 GPU)

ъ

Switchboard Results

	Test Set WER/%		
Network Architecture	Switchboard	CallHome	
GMM (ML)	21.2	36.4	
GMM (BMMI)	18.6	33.0	
DNN (7×2048) / CE	14.2	25.7	
DNN (7×2048) / MMI	12.9	24.6	
TDNN (6×1024) / CE	12.5		
TDNN (6×576) / LF-MMI	9.2	17.3	
LSTM (4×1024)	8.0	14.3	
LSTM (6×1024)	7.7	14.0	
LSTM-6 + feat fusion	7.2	12.7	

GMM and DNN results - Vesely et al (2013); TDNN-CE results - Peddinti et al (2015); TDNN/LF-MMI results - Povey et al (2016); LSTM results - Saon et al (2017)

Combining models, and with multiple RNN language models, WER reduced to 5.5/10.3% (Saon et al, 2017)

э

• Maximum likelihood estimation (MLE) sets the parameters so as to maximize an objective function *F*_{MLE}:

$$F_{\mathsf{MLE}} = \sum_{u=1}^{U} \log P_{\lambda}(\mathbf{X}_u \mid M(W_u))$$

for training utterances $X_1 \dots X_U$ where W_u is the word sequence given by the transcription of the *u*th utterance, $M(W_u)$ is the corresponding HMM, and λ is the set of HMM parameters

• Maximum mutual information estimation (MMIE) aims to directly maximise the posterior probability (sometimes called conditional maximum likelihood). Using the same notation as before, with P(w) representing the language model probability of word sequence w:

$$F_{\mathsf{MMIE}} = \sum_{u=1}^{U} \log P_{\lambda}(M(W_u) \mid \mathbf{X}_u)$$
$$= \sum_{u=1}^{U} \log \frac{P_{\lambda}(\mathbf{X}_u \mid M(W_u))P(W_u)}{\sum_{w'} P_{\lambda}(\mathbf{X}_u \mid M(w'))P(w')}$$

• Maximum mutual information estimation (MMIE) aims to directly maximise the posterior probability (sometimes called conditional maximum likelihood). Using the same notation as before, with P(w) representing the language model probability of word sequence w:

$$F_{\mathsf{MMIE}} = \sum_{u=1}^{U} \log P_{\lambda}(M(W_u) \mid \mathbf{X}_u)$$
$$F_{\mathsf{MLE}} = \sum_{u=1}^{U} \log \frac{P_{\lambda}(\mathbf{X}_u \mid M(W_u))P(W_u)}{\sum_{w'} P_{\lambda}(\mathbf{X}_u \mid M(w'))P(w')}$$

Maximum mutual information estimation

$$F_{\mathsf{MMIE}} = \sum_{u=1}^{U} \log \frac{P_{\lambda}(\mathbf{X}_{u} \mid M(W_{u}))P(W_{u})}{\sum_{w'} P_{\lambda}(\mathbf{X}_{u} \mid M(w'))P(w')}$$

Maximum mutual information estimation

$$F_{\mathsf{MMIE}} = \sum_{u=1}^{U} \log \frac{P_{\lambda}(\mathbf{X}_{u} \mid M(W_{u}))P(W_{u})}{\sum_{w'} P_{\lambda}(\mathbf{X}_{u} \mid M(w'))P(w')}$$

• **Numerator**: likelihood of data given correct word sequence ("clamped" to reference alignment)

э.

イロト イヨト イヨト

Maximum mutual information estimation

$$F_{\mathsf{MMIE}} = \sum_{u=1}^{U} \log \frac{P_{\lambda}(\mathbf{X}_{u} \mid M(W_{u}))P(W_{u})}{\sum_{w'} P_{\lambda}(\mathbf{X}_{u} \mid M(w'))P(w')}$$

- **Numerator**: likelihood of data given correct word sequence ("clamped" to reference alignment)
- **Denominator**: total likelihood of the data given all possible word sequences equivalent to summing over all possible word sequences estimated by the full acoustic and language models in recognition. ("free")

$$F_{\mathsf{MMIE}} = \sum_{u=1}^{U} \log \frac{P_{\lambda}(\mathbf{X}_{u} \mid M(W_{u})) P(W_{u})}{\sum_{w'} P_{\lambda}(\mathbf{X}_{u} \mid M(w')) P(w')}$$

- **Numerator**: likelihood of data given correct word sequence ("clamped" to reference alignment)
- **Denominator**: total likelihood of the data given all possible word sequences equivalent to summing over all possible word sequences estimated by the full acoustic and language models in recognition. ("free")
- The objective function F_{MMIE} is optimised by making the correct word sequence likely (maximise the numerator), and all other word sequences unlikely (minimise the denominator)

・ロット (雪) () () () ()

- Computing the denominator involves summing over all possible word sequences estimate by generating lattices, and summing over all words in the lattice
- In practice also compute numerator statistics using lattices (useful for summing multiple pronunciations)
- Generate numerator and denominator lattices for every training utterance
- Denominator lattice uses recognition setup (with a weaker language model)
- Each word in the lattice is decoded to give a phone segmentation, and forward-backward is then used to compute the state occupation probabilities
- Lattices not usually re-computed during training

- Sequence: like forward-backward (MLE) training, the overall objective function is at the sequence level maximise the posterior probability of the word sequence given the acoustics $P_{\lambda}(M(W_u) | \mathbf{X}_u)$
- **Discriminative:** unlike forward-backward (MLE) training the overall objective function for MMIE is discriminative to maximise MMI:
 - Maximise the numerator by increasing the likelihood of data given the correct word sequence
 - Minimise the denominator by decreasing the total likelihood of the data given all possible word sequences

This results in "pushing up" the correct word sequence, while "pulling down" the rest

- Basic idea adjust the optimization criterion so it is directly related to word error rate
- Minimum phone error (MPE) criterion

э.

イロト イヨト イヨト

- Basic idea adjust the optimization criterion so it is directly related to word error rate
- Minimum phone error (MPE) criterion

$$F_{\mathsf{MPE}} = \sum_{u=1}^{U} \log \frac{\sum_{W} P_{\lambda}(\mathbf{X}_{u} \mid M(W)) P(W) A(W, W_{u})}{\sum_{W'} P_{\lambda}(\mathbf{X}_{u} \mid M(W')) P(W')}$$

• $A(W, W_u)$ is the phone transcription accuracy of the sentence W given the reference W_u

- Basic idea adjust the optimization criterion so it is directly related to word error rate
- Minimum phone error (MPE) criterion

$$F_{\mathsf{MMIE}} = \sum_{u=1}^{U} \log \frac{\sum_{W} P_{\lambda}(\mathbf{X}_{u} \mid M(W_{\underline{u}})) P(W_{\underline{u}}) A(W, W_{u})}{\sum_{W'} P_{\lambda}(\mathbf{X}_{u} \mid M(W')) P(W')}$$

• $A(W, W_u)$ is the phone transcription accuracy of the sentence W given the reference W_u

-

イロト イヨト イヨト

- Basic idea adjust the optimization criterion so it is directly related to word error rate
- Minimum phone error (MPE) criterion

$$F_{\mathsf{MPE}} = \sum_{u=1}^{U} \log \frac{\sum_{W} P_{\lambda}(\mathbf{X}_{u} \mid M(W)) P(W) A(W, W_{u})}{\sum_{W'} P_{\lambda}(\mathbf{X}_{u} \mid M(W')) P(W')}$$

- $A(W, W_u)$ is the phone transcription accuracy of the sentence W given the reference W_u
- *F*_{MPE} is a weighted average over all possible sentences *w* of the raw phone accuracy
- Although MPE optimizes a phone accuracy level, it does so in the context of a word-level system: it is optimized by finding probable sentences with low phone error rates

- DNN-based systems are discriminative the cross-entropy (CE) training criterion with softmax output layer "pushes up" the correct label, and "pulls down" competing labels
- CE is a frame-based criterion we would like a sequence level training criterion for DNNs, operating at the word sequence level
- Can we train DNN systems with an MMI-type objective function?

- DNN-based systems are discriminative the cross-entropy (CE) training criterion with softmax output layer "pushes up" the correct label, and "pulls down" competing labels
- CE is a frame-based criterion we would like a sequence level training criterion for DNNs, operating at the word sequence level
- Can we train DNN systems with an MMI-type objective function? Yes

- Forward- and back-propagation equations are structurally similar to forward and backward recursions in HMM training
- Initially train DNN framewise using cross-entropy (CE) error function
 - Use CE-trained model to generate alignments and lattices for sequence training
 - Use CE-trained weights to initialise weights for sequence training
- Train using back-propagation with sequence training objective function (e.g. MMI)

・ロット (雪) () () () ()

Results on Switchboard "Hub 5 '00" test set, trained on 300h training set, comparing maximum likelihood (ML) and discriminative (BMMI) trained GMMs with framewise cross-entropy (CE) and sequence trained (MMI) DNNs. GMM systems use speaker adaptive training (SAT). All systems had 8859 tied triphone states.

GMMs – 200k Gaussians

DNNs - 6 hidden layers each with 2048 hidden units

	SWB	CHE	Total
GMM ML (+SAT)	21.2	36.4	28.8
GMM BMMI (+SAT)	18.6	33.0	25.8
DNN CE	14.2	25.7	20.0
DNN MMI	12.9	24.6	18.8

Veseley et al, 2013.

・ロッ ・雪 ・ ・ ヨ ・

- LSTM recurrent networks and TDNNs offer different ways to model temporal context
- LSTM and/or TDNN systems are currently state-of-the-art
- Sequence training: discriminatively optimise GMM or DNN to a sentence (sequence) level criterion rather than a frame level criterion
 - ML training of HMM/GMM sequence-level, not discriminative
 - $\bullet\,$ CE training of HMM/NN discriminative at the frame level
 - MMI training of HMM/GMM or HMM/NN discriminative at the sequence level
- Usually initialise sequence discriminative training
 - HMM/GMM first train using ML, followed by MMI
 - HMM/NN first train at frame level (CE), followed by MMI
