Speech Signal Analysis 2

Hao Tang

Automatic Speech Recognition—ASR Lecture 3
23 January 2023

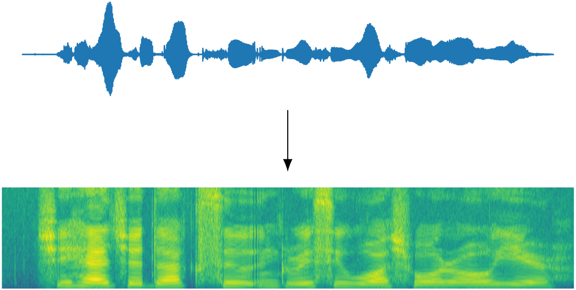
Announcement

- Please sign up for Piazza (`https://piazza.com/class/lbuv1ztgtdllv`)
- The labs will start on week 3.

Outline

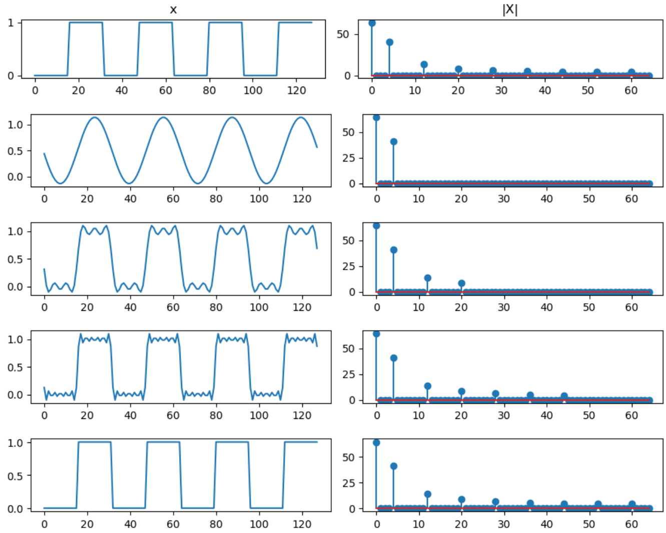
- Recap of spectrograms
- Auditory system
  - Masking
  - Mel filters
- Speech production model
  - Fundamental frequencies
  - Formants
- Mel Frequency Cepstral Coefficients

Spectrogram

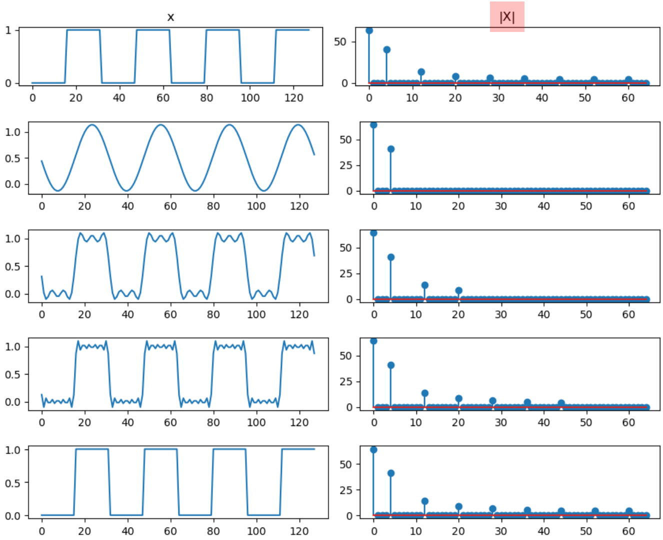


- dithering, removing DC offset, pre-emphasis
- windowing
- Discrete Fourier transform (DFT)
- Short-time Fourier transform (STFT)

Discrete Fourier Transform



Discrete Fourier Transform



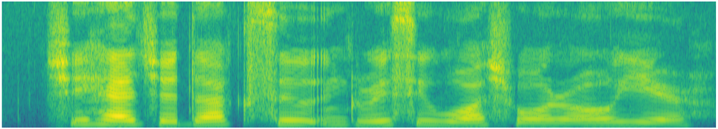
Complex Numbers

$$X[k] = a + bi$$

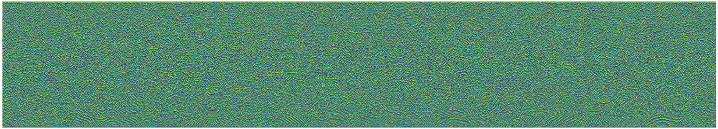
- Real: $\mathfrak{R}\{X[k]\} = a$
- Imaginary: $\mathfrak{Im}\{X[k]\} = b$
- Magnitude: $|X[k]| = \sqrt{a^2 + b^2}$
- Phase: $\angle X[k] = \arccos \frac{a}{\sqrt{a^2+b^2}}$
- Energy: $|X[k]|^2$

Spectrogram

Magnitude



Phase



- Spectrogram = Magnitude spectrogram = Power spectrogram
- Phase is not as important as magnitude for speech intelligibility.

Auditory Masking

- One sound affects the presense of another sound.
- Both sounds are present, so masking is purely perceptual.
- Masking is a nonlinear effect.
- Many applications take advantage of masking (e.g., MP3).

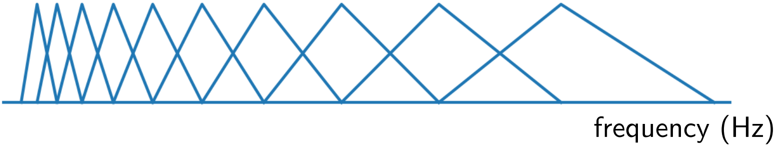
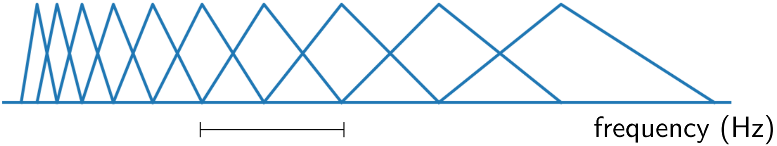
Auditory Filters



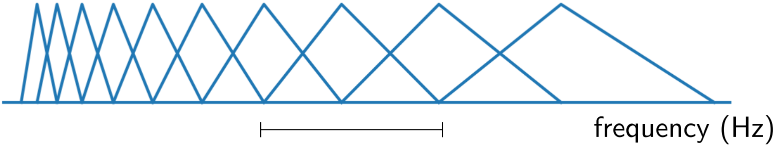
- Triangle-shaped
- Asymmetric
- Sensitive to the amount of energy
- With larger bandwidth at higher frequency

Auditory Filters



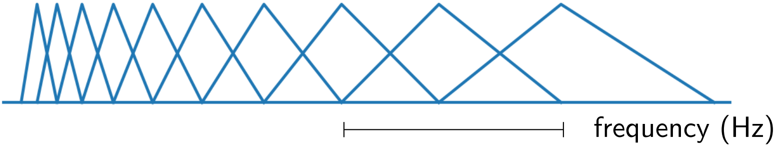
- Triangle-shaped
- Asymmetric
- Sensitive to the amount of energy
- With larger bandwidth at higher frequency

Auditory Filters



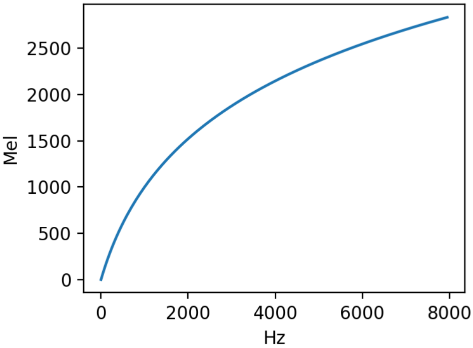
- Triangle-shaped
- Asymmetric
- Sensitive to the amount of energy
- With larger bandwidth at higher frequency

Auditory Filters



- Triangle-shaped
- Asymmetric
- Sensitive to the amount of energy
- With larger bandwidth at higher frequency

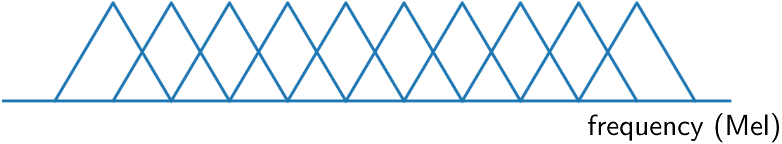
Mel Scale



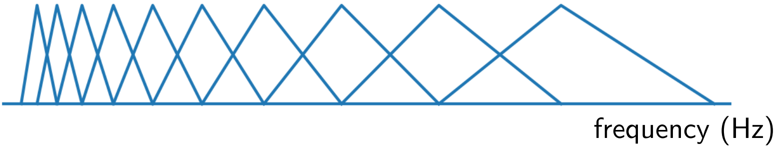
$$m = 1127 \log\left(1 + \frac{f}{700}\right)$$

- 300 Hz vs 310 Hz
- 2000 Hz vs 2010 Hz

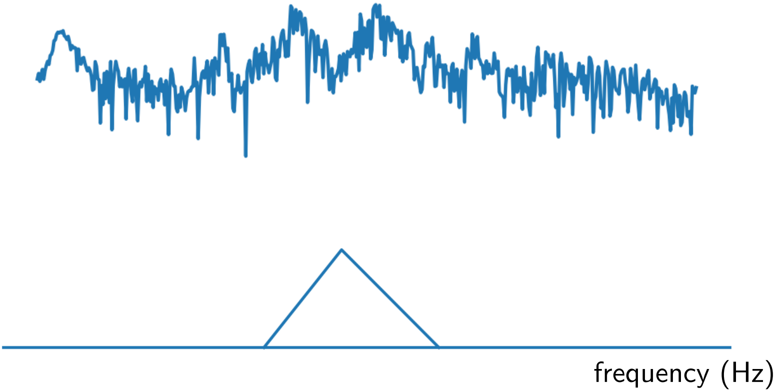
Mel Filters



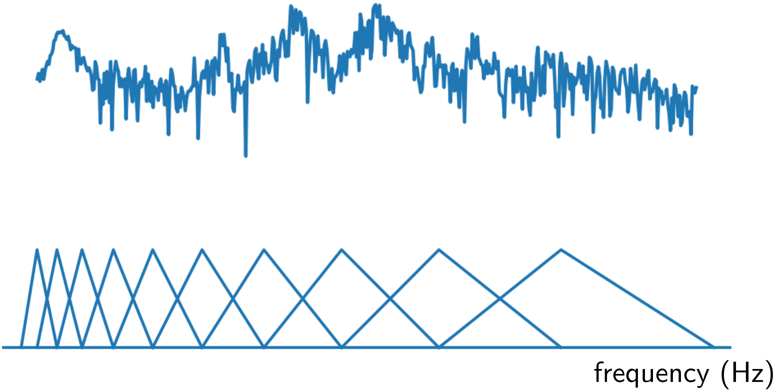
Mel Filters



Mel Filters



Mel Filters



Mel Filters

$$Y[n] = \sum_{k=0}^{T-1} X[k] \cdot H_n[k]$$

- H_n is the n-th Mel filter.
- Mel filters are applied to the magnitude spectrum with dot product.
- The result is an n-dimensional vector for n Mel filters.

Mel Filters

$$Y[n] = \sum_{k=0}^{T-1} X[k] \cdot H_n[k]$$

$$Y = \begin{bmatrix} H_1[0] & H_1[1] & \cdots \\ H_2[0] & H_2[1] & \cdots \\ \vdots & \vdots & \\ H_n[0] & H_n[1] & \cdots \end{bmatrix} \begin{bmatrix} X[0] \\ X[1] \\ \vdots \\ X[T-1] \end{bmatrix} = \begin{bmatrix} H_1 \\ H_2 \\ \vdots \\ H_n \end{bmatrix} X = HX$$

Vowel Production

- Fundamental frequency
  - The first frequency component of the glottal pulse
  - Leading to pitch when perceived
- Harmonics
  - Subsequent frequency components of the glottal pulse
- Formants
  - Resonance frequencies of the vocal tract
  - Leading to the production and perception of certain phones, particularly vowels

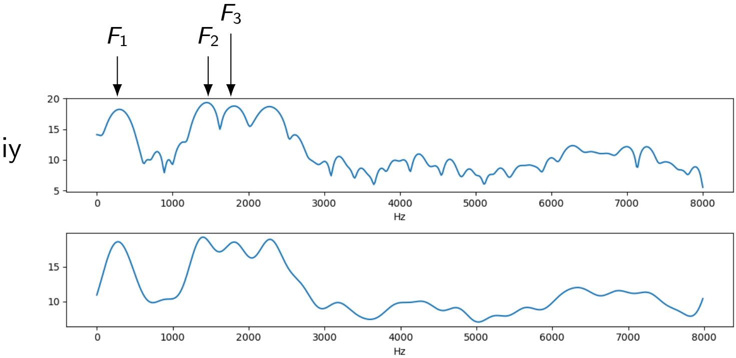
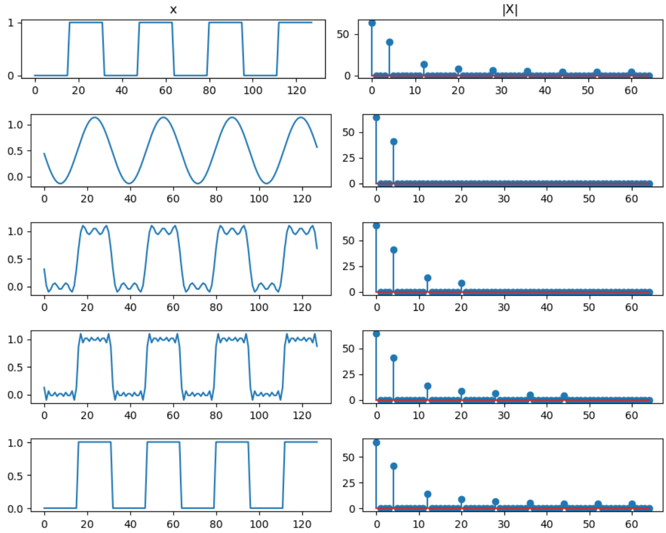
Spectral Shape



Discrete Fourier Transform



Mel Frequency Cepstral Coefficients (MFCCs)

- Extract Mel spectrogram.
- Apply DFT to every spectrum.
- Truncate the high-frequency components.

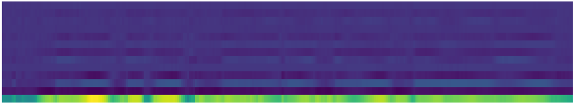
MFCC



"All models are wrong, but some are useful."

–George Box, 1978

Summary

- dithering
- removing DC offset
- pre-emphasis
- windowing
- DFT
- Apply Mel filters
- DCT
- Truncate the high-frequency components

Further Reading

- Chapter 3–4, O'Shaughnessy, "Speech Communications: Human and Machine," 2000.
