

# C Quick Reference

## Data types

type	value	printf/scanf
int	42	%d
char	'd'	%c
float	4.3, 5.6e7	%f
double	4.3, 5.6e7	%lf
char *	"a string"	%s

## Pointer types

Declare a pointer to int with

```
int *myptr;
```

Set myptr to point to a with

```
myptr = &a;
```

and use it with

```
*myptr = 42; // same as a = 42
```

## Operators and relations

Highest precedence first, bars separate precedences		
++ --	increment, decrement	a++
()	function call	mean(5.6,44)
[]	array subscript	array[7]
.	struct field	p.x
->	struct field via ptr	p_ptr->x
-	unary minus	-a
!	not	!b
(type)	cast	(double)4.3
*	deference	*p_ptr
&	address of	&p
* / %	multn, divn, mod	a * 4.2
+ -	addn, subtracn	a+3
< <= > >=	gtr/less than/or equal	a <= b
== !=	(not) equal	a + 3 == b/7
&&	logical and	a && b
	logical or	a    b
=	assignment	a = b+3

## Control flow

Assignment: a = b+3;

Conditionals:

```
if ( a > 3 ) {
    b++;
} else {
    b--;
}
```

Iteration:

```
while ( i < n ) {
    ...
}
```

```
for (i = 0; i < n; i++) {
    ...
}
```

break; terminates a for or while loop.

continue; skips the rest of the loop body this time round

Switch statement:

```
switch ( i ) {
    case 0:
        ...
        break;
    case 1: case 2:
        ...
        break;
    default:
        ...
}
```

## Functions

Prototype:

```
char nthcharof(char *, int);
```

Definition:

```
char nthcharof(char *str, int n) {
    return str[n];
}
```

Use:

```
char *mystr = "a boring string";
char c;
c = nthcharof(mystr,7);
```

## Structs

Declaring a struct type with typedef:

```
typedef struct {
```

```
    int n;
    char *str;
} mytype;
```

Using structs:

```
mytype x;
x.n = 42;
x.str = "forty-two";
Pointers and structs:
mytype *xptr = &x;
xptr->n = 43;
xptr->str = "forty-three";
```

## Enums

typedef enum { FIRST, SECOND } num\_t; Enums are ints; start from zero by default. Can do:

```
typedef enum { APPLE = 3, PEAR, ORANGE } fruit_t
to start from 3, or
```

```
typedef enum { LEEK = 5, TOM = 8, CARROT = 10 } veg_t
for arbitrary values
```

## Strings

are null-terminated arrays of chars.

Useful functions (`#include <string.h>`):

```
char *s, *s1, *s2;
strlen(s) length of s, excluding final null
strcpy(s1,s2); copy contents of s2 into s1
strcmp(s1,s2); return -1, 0, 1 as s1 is <,=,> s2 in
lexicographic order
sprintf(s,...) print into s
sscanf(s,...) read from s
```

## Arrays

Declaring:

```
int myarray[10];
```

Using

```
myarray[i+1] = 2*myarray[i];
```

Arrays and pointers: `myarray[i]` is the same as `*(&myarray[i])`, and `&(myarray[i])` is the same as `myarray+i`

Arrays and strings: after

```
char achar[] = { 'a', 'b', 'c', 'd', 0 };
```

```
char *mystr = achar;
```

`mystr` is the string "abcd", and `achar[i] == mystr[i]`

## Basic i/o

Printing formatted strings:

```
int n; double f; char c; char *str;
printf("n is %d, f is %f, c is %c, str is %s\n",
      n,f,c,str);
```

Reading variables from input:

```
scanf("%d %lf %c %s",&n,&f,&c,str)
```

(N.B. no `&` for `%s`)

`scanf` skips white space before numbers or strings, and when there is a space in the format string.

Skipping a value: `"%*s"`

Useful printf format modifiers:

`%3d` pad with blanks on left to 3 columns

`%03d` pad with zeros on left to 3 columns

`.3f` print to 3 decimal places

Character i/o:

```
int c; /* N.B. int NOT char */
c = getchar();
putchar(c);
```

## File i/o

Input:

```
char *filename = "foo.txt";
FILE *infile;
infile = fopen(filename,"r");
fscanf(infile,"%d",&n);
char c = fgetc(infile);
```

Output:

```
FILE *outfile;
outfile = fopen(filename,"w");
fprintf(outfile,"n is %d\n",n);
fputc(c,outfile);
fclose(outfile);
```

## Character identification

```
#include <ctype.h>
```

provides

```
int isalpha(int c); and similarly isdigit, isupper,
islower, isspace
and int toupper(int c); and similarly tolower.
```

## Descartes quick reference

Types: `point_t, lineSeg_t`.

Functions: `point_t GetPoint(void);` Waits until the user clicks the mouse, then returns the point that the user is indicating.

`point_t Point(int a, int b);` Creates a point with given coordinates.

`int XCoord(point_t p);` Returns the x-coordinate of the point given as argument.

`int YCoord(point_t p);` Returns the y-coordinate of the point given as argument.

`lineSeg_t LineSeg(point_t p1, point_t p2);` Creates a line segment with given endpoints.

`point_t InitialPoint(lineSeg_t l);` Returns one endpoint of a line segment ...

`point_t FinalPoint(lineSeg_t l);` ... returns the other endpoint.

`float Length(lineSeg_t l);` Returns the length of a line segment.

`void DrawLineSeg(lineSeg_t l);` Draws a line segment.

`void OpenGraphics(void);` Opens and initialises the graphics window

`void CloseGraphics(void);` Closes the graphics window

## Writing and compiling Descartes programs

The program must have the header line

```
#include "descartes.h"
```

To compile `myprog.c` that uses Descartes, do

```
gcc -Wall myprog.c descartes.o -lSDL
```

If the program also uses the maths library, add `-lm`.
