

Computer Programming: Skills & Concepts (CP) Functions

Julian Bradfield

Monday 9 October 2017

CP Lect 7 – slide 1 – Monday 9 October 2017

This Lecture: Functions

- ▶ Motivation: reading dates
- ▶ Functions formally
- ▶ Scoping
- ▶ (Time allowing) live coding

CP Lect 7 – slide 3 – Monday 9 October 2017

Summary of Lecture 6

- ▶ The while statement.
- ▶ The for statement.
- ▶ `fibonacci.c`

CP Lect 7 – slide 2 – Monday 9 October 2017

Read a day and a month.

Day Between 1 and 31
Month Between 1 and 12

Months have different numbers of days, but we'll ignore that.

CP Lect 7 – slide 4 – Monday 9 October 2017

```

#include <stdio.h>
#include <stdlib.h>
int main() {
    /* Read a Day */
    int day = 0;
    while (day < 1 || day > 31) { /* Ask until day is valid */
        printf("Enter a value between 1 and 31:");
        scanf("%d", &day);
    }
    /* Read a Month */
    int month = 0;
    while (month < 1 || month > 12) {
        printf("Enter a value between 1 and 12:");
        scanf("%d", &month);
    }
    printf("You entered %d of %d\n", day, month);
    return EXIT_SUCCESS;
}

```

These are very similar. Write it once?

CP Lect 7 – slide 5 – Monday 9 October 2017

GenericFunction: Read a value from 1 to maximum

```

int ReadValue(int maximum) {
    /* To Do: Get maximum from somewhere. */
    int value = 0;
    while (value < 1 || value > maximum) {
        printf("Enter a value between 1 and %d:", maximum);
        scanf("%d", &value);
    }
    /* Use value for the day or month. */
    return value;
}

```

CP Lect 7 – slide 6 – Monday 9 October 2017

Functions ‘wrap up’ a piece of code.

```

#include <stdio.h>
#include <stdlib.h>

int ReadValue(int maximum) {
    int value = 0;
    while (value < 1 || value > maximum) {
        printf("Enter a value between 1 and %d:", maximum);
        scanf("%d", &value);
    }
    return value;
}

int main() {
    int day = ReadValue(31); /* Call with maximum = 31 */
    int month = ReadValue(12); /* Call with maximum = 12 */
    printf("You entered %d of %d\n", day, month);
    return EXIT_SUCCESS;
}

```

CP Lect 7 – slide 7 – Monday 9 October 2017

Functions Formally

A function encapsulates code.

```
int ReadValue(int maximum) { ... }
```

Like a mathematical function, it takes inputs and returns a value.
Unlike a mathematical function, it can return different values:

```

/* Ask the user then print the value */
printf("%d", ReadValue(12));
/* Ask the user again then print the new value */
printf("%d", ReadValue(12));

```

CP Lect 7 – slide 8 – Monday 9 October 2017

Always Have a Return Statement

Bad Code:

```
int AddTwo(int to) {  
    to + 2;  
}
```

Good Code:

```
int AddTwo(int to) {  
    return to + 2;  
}
```

CP Lect 7 – slide 9 – Monday 9 October 2017

Multiple Inputs

Functions can have any number of arguments (inputs).

```
int Sum0() { return 0; }  
int Sum1(int first) { return first; }  
int Sum2(int first, int second) { return first + second; }
```

CP Lect 7 – slide 11 – Monday 9 October 2017

Returning Nothing

`void` means there is nothing to return. `return` can be omitted for `void`.

Bad Code:

```
int SayHello() {  
    printf("Hello\n");  
}
```

Good Code:

```
void SayHello() {  
    printf("Hello\n");  
    return;  
}
```

Good Code:

```
void SayHello() {  
    printf("Hello\n");  
}
```

CP Lect 7 – slide 10 – Monday 9 October 2017

Return Happens Immediately

Bad Code:

```
/* Actually returns value */  
int AddTwo(int value) {  
    return value;  
    /* Never reached */  
    value = value + 2;  
}
```

Good Code:

```
int AddTwo(int value) {  
    value = value + 2;  
    return value;  
}
```

CP Lect 7 – slide 12 – Monday 9 October 2017

Returning Early

`return`'s immediate effect can be useful:

```
/* Take the absolute value of the number */
int AbsoluteValue(int number) {
    if (number >= 0) {
        /* All non-negative numbers will return here. */
        return number;
    }
    /* Now we know that number < 0 */
    return -number;
}
```

CP Lect 7 – slide 13 – Monday 9 October 2017

Names Change

Good Code:

```
void PrintTwo(int start) {
    printf("%d\n", start + 2);
}

int main() {
    int alice = 0, bob = 1;
    PrintTwo(alice); /* Run PrintTwo with start = 0 */
    PrintTwo(bob);   /* Run PrintTwo with start = 1 */
    return EXIT_SUCCESS;
}
```

Value of `alice` or `bob` becomes `start`

CP Lect 7 – slide 15 – Monday 9 October 2017

Scoping

Functions do not share variables.

Bad Code:

```
int AddTwo() { return value + 2; }
void Print() {
    int value = 0;
    printf("%d", AddTwo());
}
```

Good Code:

```
int AddTwo(int value) { return value + 2; }
void Print() {
    int value = 0;
    printf("%d", AddTwo(value));
}
```

CP Lect 7 – slide 14 – Monday 9 October 2017

Formalizing Function Calls

Functions run in an *environment*.

When we call a function:

1. Create a new environment.
2. Copy the arguments to their new names.
3. Run the function.
4. Save the return value.
5. Clean up the environment.

This is why functions can't see variables outside their environment.

CP Lect 7 – slide 16 – Monday 9 October 2017

Call Example

```
int AddTwo(int value) {  
    return value + 2;  
}  
  
int main() {  
    int alice = 0;  
    int bob = AddTwo(alice);  
    printf("%d", bob);  
    return EXIT_SUCCESS;  
}
```

1. Make an environment for AddTwo.
2. Copy 0 to value (since alice is 0).
3. Run value + 2.
4. Save the return value.
5. Restore main's environment.
6. Continue running main, which will copy return to bob.

CP Lect 7 – slide 17 – Monday 9 October 2017

Declare Before Use

Bad Code:

```
int AddFour(int to) {  
    /* AddTwo not yet declared */  
    return AddTwo(AddTwo(to));  
}  
  
int AddTwo(int to) {  
    return to + 2;  
}
```

Good Code:

```
int AddTwo(int to) {  
    return to + 2;  
}  
  
int AddFour(int to) {  
    return AddTwo(AddTwo(to));  
}
```

CP Lect 7 – slide 19 – Monday 9 October 2017

Arguments Are Copies

Changes do not impact callers:

```
void FailsToIncrement(int value) {  
    /* Increments a copy in its own environment */  
    value = value + 1;  
}  
  
void Fail() {  
    int number = 0;  
    /* Send a copy of number */  
    FailsToIncrement(number);  
    /* Prints 0 */  
    printf("%d", number);  
}
```

CP Lect 7 – slide 18 – Monday 9 October 2017

Declaring Separately

Good Code:

```
/* Tell the compiler that AddTwo is a function taking an int  
   and returning an int. No need to name variables. */  
int AddTwo(int);  
  
int AddFour(int to) {  
    return AddTwo(AddTwo(to));  
}  
  
int AddTwo(int to) {  
    return to + 2;  
}
```

CP Lect 7 – slide 20 – Monday 9 October 2017

Summarizing Functions

Functions let you encapsulate code.

Use functions to:

- ▶ Reduce repetition
- ▶ Group functionality together
- ▶ Explain what a chunk of code does (by naming it)

CP Lect 7 – slide 21 – Monday 9 October 2017

Learning more

Reading Assignment:

Chapter 5 (sections 5.1-5.5) of “A book on C”.

Lecture 8:

We will continue the “Functions” theme in Lecture 8.

CP Lect 7 – slide 22 – Monday 9 October 2017
