# Summary of Lecture 4

► Integer arithmetic in C.

- Converting pre-decimal money to decimal.
- The int type and its operators.
- ► Numeric *variables*.

Computer Programming: Skills & Concepts (INF-1-CP1) Variables; scanf; Conditional Execution

30th September, 2010

CP1-5 - slide 1 - 30th September, 2010

## Tutorials

- ► Start next week.
- Tutorial groups can be viewed from the appropriate webpage: https://www.inf.ed.ac.uk/admin/itodb/mgroups/stus/cp1.html
- Contact the ITO if your tutorial group clashes with another lecture, or if you have not been assigned to any group (and are officially registered for CP1).

CP1-5 - slide 3 - 30th September, 2010

## Today's lecture

- Assigning and Re-assigning variables;
- ▶ The if-statement.
- ► Fixing the lsd program.
- Input using scanf.

#### Reprise: Variables in C

Variables are "boxes" to store a value

- Bit like variables in mathematics (may have varying assignments);
- A C variable holds a single value;
- Have to define what type of item a variable will hold, eg: int x; or maybe int x = 2;
- In C, the value can change over time as a result of program statements which act on the variable, eg:
  - x = x + 1;

## The Assignment Statement

A variable is updated by an assignment statement

#### **n** = 22 \* n + 1;

The left-hand side n is the variable being updated. The right-hand side 22 \* n + 1 is an *expression* for the new value. *First* compute the expression, *then* change the variable to the new value.

CP1-5 - slide 5 - 30th September, 2010

## Reprise: Updating Variables

int n; 
<-- n is defined
</pre>
n = 2 \* n; 
n = 0; 
n = n + 1; 
<-- n gets the value 9
n = n + 1; </pre>
<-- n gets the value 9+1, ie 10
n = 22 \* n + 1; </pre>
<-- n gets the value ?
++n; </pre>
<-- n gets the value ?
n++; </pre>

CP1-5 - slide 7 - 30th September, 2010

## The Assignment Statement

A variable is updated by an assignment statement

**n** = 22 \* n + 1;

The left-hand side n is the variable being updated. The right-hand side 22 \* n + 1 is an *expression* for the new value. *First* compute the expression, *then* change the variable to the new value.

WARNING: C also allows assignments as expressions:

(n = 22 \* n + 1)

is an expression which computes 22 \* n + 1, sets n to the result, and overall computes to the new value of n. So you can write:

$$m = (n = 2*n) + 3;$$

DON'T do this! You may see assignment expressions, but they are never necessary.

Main danger is doing it by accident!

CP1-5 - slide 8 - 30th September, 2010

*CP1–5 – slide 6 – 30th September, 2010* 

#### Shorthand Assignment Operators

C programmers are lazy! C provides shorthand for some very common assignments, for example:

х +	= 7;	//	$\mathtt{same}$	as	х	=	х	+	7;
x *	= 2;	//	same	as	х	=	х	*	2;
х –	= 3;	//	same	as	х	=	х	-	3;
x /	= 3;	//	same	as	х	=	х	/	3;

Note that, e.g.  $x \ast = y + z$ ; means  $x = x \ast (y + z)$ ;.

Use these only if you're completely confident with them.

# Shorthand Assignment Expressions (2)

Similarly n-- computes to value of n and **then** decreases n by 1. Much less often you will see ++n and --n: **first** increase/decrease n by 1, and then compute to the new value of n.

**Warning:** Easy to get confused, and/or run into subtleties of C. Suggest using these only in **for**-loops etc. (See later.)

CP1-5 - slide 9 - 30th September, 2010

## Shorthand Assignment Expressions

For even greater laziness, C provides some special assignment *expressions*. Unlike general assignment expressions, these are very commonly used.

n++

is an expression which computes to the value of n, and  $\ensuremath{\textit{afterwards}}$  increases n by 1.

int n = 2, m = 3;

CP1-5 - slide 11 - 30th September, 2010

# if statement - basic form

- Allows two different strands of execution, depending on the result of evaluating (condition).
- ► *(condition)* is any boolean expression.
- ► *(statement-sequence)* is any legal sequence of C statements.
- ▶ The else {... } is optional.

#### MAX of two integer variables

```
if (x > y) {
    printf("MAX is %d: ", x);
} else {
    printf("MAX is %d: ", y);
}
```

- (x > y) is the condition to be evaluated. It evaluates to True only if x is larger than y.
- ▶ where did we get the values x and y?

CP1-5 - slide 13 - 30th September, 2010

## Conditions on integers

C has the standard mathematical relations <, >, ==, <=, >=. Remember that 'is equal to' == is a double equals sign!

Examples:

# Fixing the old money $\rightarrow$ new money calculation

We did (this year: should have done)

Probably we don't like the rounding: 2 old pence converts to (2 \* 100)/240 = 0 in integers. But 2d is really  $\frac{5}{6}$ p, so we should round to 1p.

Standard rounding is round  $\frac{1}{2}$  or greater up, less than  $\frac{1}{2}$  down. We can add the lines

```
if ( ( totaloldpence * NEW_PENCE_PER_POUND ) % OLD_PENCE_PER_POUND
>= (OLD_PENCE_PER_POUND/2) ) {
    newpence += 1;
}
```

Exercise: do the same without using if. Harder exercise: what hidden assumption have I made above?

```
CP1-5 - slide 15 - 30th September, 2010
```

# Fixing the printing of new pence

We did:

printf("is %d.%d in new money\n",pounds,newpence);

But this prints 4 pounds and 1 penny as 4.1, not 4.01. Fix:

```
printf(" is %d.");
if ( newpence < 10 ) {
    printf("0%d",newpence);
else {
    printf("%d",newpence);
}
printf(" in new money\n");
```

#### Fixing the printing of new pence

#### We did:

printf("is %d.%d in new money\n",pounds,newpence);

But this prints 4 pounds and 1 penny as 4.1, not 4.01. Fix:

```
printf(" is %d.");
if ( newpence < 10 ) {
    printf("0%d",newpence);
else {
    printf("%d",newpence);
}
printf(" in new money\n");
```

Actually, there's an easier way, with fancier features of printf.

```
printf("is %d.%02d is new money\n",pounds,newpence);
```

```
CP1-5 - slide 17 - 30th September, 2010
```

#### Input with scanf

scanf is the twin of printf. Reads numbers from input and stores them in variables.

But scanf requires a "&" before its arguments. (Explanation later in the course...)

```
int x;
scanf("%d", &x);
printf("%d", x);
For example:
```

```
#include <stdio.h>
int main(void) {
    int x, y;
    printf("Input the two integers: ");
    scanf("%d", &x);
    scanf("%d", &y);
    if (x > y) {
        printf("MAX is %d: ", x);
    } else {
        printf("MAX is %d: ", y);
    }
    return EXIT_SUCCESS;
```

#include <stdlib.h>

}
