Philipp Koehn DIL Lecture 11 13 February 2006

Homonym

• Sometimes two completely different words are spelled the same

• Distinction between Polysemy and Homonymy not always clear

• This is called a Homonym

- modal verb: You can do it!

- container: She bought a can of soda.

• Example: can

Philipp Koehn

How many senses?

DIL Lecture 11

Word Senses

- How many senses does the word interest have?
- She pays 3% interest on the loan. - He showed a lot of interest in the painting.

Some words have multiple meanings

- financial institution: I put my money in the bank.

- river shore. He rested at the bank of the river. • How could a computer tell these senses apart?

• This is called Polysemy

• Example: bank

- Microsoft purchased a controlling interest in Google.
- It is in the national interest to invade the Bahamas.
- I only have your best interest in mind.
- Playing chess is one of my interests.
- Business interests lobbied for the legislation.
- Are these seven different senses? Four? Three?

Wordnet

DIL Lecture 11

- One way to define senses is to look them up in Wordnet, a hierarchical database of senses
- According to Wordnet, interest has 7 senses:
 - Sense 1: a sense of concern with and curiosity about someone or something, Synonym: involvement
 - Sense 2: the power of attracting or holding one's interest (because it is unusual or exciting etc.), Synonym: interestingness
 - Sense 3: a reason for wanting something done, Synonym: sake
 - Sense 4: a fixed charge for borrowing money; usually a percentage of the amount borrowed
 - Sense 5: a diversion that occupies one's time and thoughts (usually

Philipp Koehr DIL Lecture 11 13 February 2006

nformatics

Different sense = different translation

- Another way to define senses: if occurrences of the word have different translations, these indicate different sense
- Example interest translated into German
 - Zins: financial charge paid for load (Wordnet sense 4)
 - Anteil: stake in a company (Wordnet sense 6)
 - Interesse: all other senses

finformatics

- pleasantly), Synonyms: pastime, pursuit
- Sense 6: a right or legal share of something; a financial involvement with something, Synonym: stake
- Sense 7: (usually plural) a social group whose members control some field of activity and who have common aims, Synonym: interest group
- Organization of Wordnet
 - Wordnet groups words into synsets.
 - polysemous words are part of multiple synsets
 - synsets are organized into a hierarchical structure of is-a relationships, e.g. a dog is-a pet, pet is-a animal
- Is Wordnet too fine grained?

Philipp Koehn DIL Lecture 11 13 February 2006

7 inf School of tics

Languages differ

- Foreign language may make finer distinctions
- Translations of river into French
 - fleuve: river that flows into the sea
 - rivière smaller river
- English may make finer distinctions than a foreign language
- Translations of German Sicherheit into English
- security
- safety
- confidence

DIL Lecture 11 13 February 2006 Philipp Koehn DIL Lecture 11 13 February 2006 Philipp Koehn

g informatics

One last word on senses

- A lot of research in word sense disambiguation is focused on polysemous words with clearly distinct meanings, e.g. bank, plant, bat,
- Often meanings are close and hard to tell apart, e.g. area, field, domain, part, member.
 - She is a part of the team.
 - She is a member of the team.
 - The wheel is a part of the car.
 - * The wheel is a member of the car

Philipp Koehn

DIL Lecture 11

13 February 2006

• For many applications, we would like to disambiguate senses - we may be only interested in one sense

- - searching for chemical plant on the web, we do not want to know about chemicals in bananas

Word sense disambiguation (WSD)

- Task: Given a polysemous word, find the sense in a given context
- Popular topic, data driven methods perform well

DIL Lecture 11 Philipp Koehr

nformatics

WSD as supervised learning problem

- Words can be labeled with their senses
 - She pays 3% interest/INTEREST-MONEY on the loan.
 - He showed a lot of interest/INTEREST-CURIOSITY in the painting.
- Similar to tagging
 - given a corpus tagged with senses
 - define features that indicate one sense over another
 - learn a model that predicts the correct sense given the features
- We can apply similar supervised learning methods
 - Naive Bayes, related to HMM
 - Transformation-based learning
 - Maximum entropy learning

Philipp Koehn DIL Lecture 11 13 February 2006

10 Informatics

More features

- Syntactically related words
- Syntactic role in sense
- Topic of the text
- Part-of-speech tag, surrounding part-of-speech tags

DIL Lecture 11 Philipp Koehi 13 February 2006

nf School of tics

Naive Bayes

- ullet We want to predict the sense S given a set of features F
- First, apply the Bayes rule

Philipp Koehn

$$\operatorname{arg\,max}_S p(S|F) = \operatorname{arg\,max}_S p(F|S) p(F) \tag{1}$$

ullet Then, decompose p(F) by assuming all features are independent (that's *naive*!)

$$p(F) = \prod_{f_i \in F} p(f_i|S) \tag{2}$$

ullet The $\mathit{prior}\, p(S)$ and the conditional $\mathit{posterior}\, \mathsf{probabilities}\, p(f_i|S)$ can be learned by maximum likelihood estimation DIL Lecture 11

Simple features

- Directly neighboring words
 - plant life
 - manufacturing plant
 - assembly plant
 - plant closure
- plant species
- Any content words in a 10 word window (also larger windows)

 - equipment
 - employee
- automatic

Philipp Koehn 13 February 2006 DIL Lecture 11

13 informatics

Training data for supervised WSD

- SENSEVAL competition
 - bi-annual competition on WSD
 - provides annotated corpora in many languages
- Pseudo-words
 - create artificial corpus by artificially conflate words
 - example: replace all occurrences of banana and door with banana-door
- Multi-lingual parallel corpora
 - translated texts aligned at the sentence level
 - translation indicates sense

Philipp Koehr DIL Lecture 11 13 February 2006

f informatics

Decision list

- Yarowsky [1994] uses a decision list for WSD
 - two senses per word
- rules of the form: collocation \rightarrow sense
- example: $\textit{manufacturing plant} \rightarrow \textit{PLANT-FACTORY}$
- rules are ordered, most reliable rules first
- when classifying a test example, step through the list, make decision on first rule that applies
- Learning: rules are ordered by

$$\log \left(\frac{p(sense_A|collocation_i)}{p(sense_B|collocation_i)} \right)$$
 (3)

Smoothing is important

13 February 2006 Philipp Koehn DIL Lecture 11 13 February 2006

Bootstrapping

- Yarowsky [1995] presents bootstrapping method
 - 1. label a few examples
 - 2. learn a decision list
 - 3. apply decision list to unlabeled examples, thus labeling them
 - 4. add newly labeled examples to training set
 - 5. go to step 2, until no more examples can be labeled
- Initial starting point could also be
 - a short decision list
 - words from dictionary definition

One sense per discourse

17 informatics

• Rules encode the principle: One sense per collocation

• Bootstrapping method also uses important principle: One sense per discourse

- in one discourse only one sense of a polysemous word appears
 text talks either about PLANT-FACTORY or PLANT-LIVING
- Improved bootstrapping method
 - after labeling examples, one sense per discourse principle is enforced
 - $\boldsymbol{\mathsf{-}}$ all examples in one document are labeled with the same sense
 - or, examples that are not in the majority sense are un-labeled
