

Breadth-first search

Expand shallowest unexpanded node

Implementation:

 $fringe \ \mbox{is a FIFO} \ \mbox{queue} \ \mbox{(First In First Out)}, i.e., new successors go at end$

- Recall: Strategies are evaluated along the following dimensions: completeness—does it always find a solution if one exists? time complexity—number of nodes generated/expanded space complexity—maximum number of nodes in memory optimality—does it always find a least-cost solution?
- Time and space complexity are measured in terms of *b*—maximum branching factor of the search tree *d*—depth of the least-cost solution *m*—maximum depth of the state space (may be infinite)

Complete??

Properties of breadth-first search

<u>Complete</u>?? Yes (if *b* is finite)

<u>Time</u>??

Properties of breadth-first search

<u>Complete</u>?? Yes (if b is finite) <u>Time</u>?? $1 + b + b^2 + b^3 + \ldots + b^d + b(b^d - 1) = O(b^{d+1})$, i.e., exp. in d <u>Space</u>??

Properties of breadth-first search

<u>Complete</u>?? Yes (if *b* is finite)

<u>Time</u>?? $1 + b + b^2 + b^3 + \ldots + b^d + b(b^d - 1) = O(b^{d+1})$, i.e., exp. in d

Space?? $O(b^{d+1})$ (keeps every node in memory)

Optimal?? Yes (if cost = 1 per step); not optimal in general

Space is the big problem; can easily generate nodes at 10MB/sec - so 24hrs = 860GB.

informatics

Uniform-cost search

Expand least-cost unexpanded node

Implementation:

 $\mathit{fringe} = \mathsf{queue} \ \mathsf{ordered} \ \mathsf{by} \ \mathsf{path} \ \mathsf{cost}$

Equivalent to breadth-first if step costs all equal

Complete?? Yes, if step cost $\geq \epsilon$ for $\epsilon > 0$

<u>Time</u>?? # of nodes with $g \leq \text{ cost of optimal solution}$, $O(b^{\lceil C^*/\epsilon \rceil})$ where C^* is the cost of the optimal solution

Space?? # of nodes with $g \leq \text{ cost of optimal solution, } O(b^{\lceil C^*/\epsilon \rceil})$

Optimal?? Yes—nodes expanded in increasing order of g(n)

Summary of algorithms

Criterion	Breadth- First	Uniform- Cost	Depth- First	Depth- Limited	Iterative Deepening
Complete?	Yes*	Yes*	No	Yes, if $l \ge d$	Yes
Time	b^{a+1}	$b^{ C /\epsilon }$	b^m	b^{ι}	b^a
Space	b^{d+1}	$b^{\lceil C^*/\epsilon \rceil}$	bm	bl	bd
Optimal?	Yes*	Yes*	No	No	Yes

Here * indicates conditions stated earlier.

24 informatics

Repeated states

Failure to detect repeated states can turn a linear problem into an exponential one!

Graph search

The state space with actions leading from state to state corresponds naturally to a **graph** rather than a **tree**; the state appears only once in the graph.

There are data structures corresponding to graphs, and graph search algorithms that avoid repetition of states already seen.

The idea is to keep track of nodes that have already been expanded; if search arrives back at such a node, it is ignored in future search.

See Russell and Norvig for details.

Summary

- Problem formulation usually requires abstracting away real-world details to define a state space that can feasibly be explored
- Variety of uninformed search strategies
- Iterative deepening search uses only linear space and not much more time than other uninformed algorithms
