Informatics 2A: Tutorial Sheet 8 (Week 10) Agreement; First order logic; Compositional semantics SHAY COHEN

1. As noted in Lecture 25, present tense verbs in English agree with their subject in number (*I sleep; he sleeps; they sleep*). Another agreement constraint in English is that reflexive pronouns (e.g. *herself, itself, them-selves*) must agree with the noun phrase they stand for in person, number and gender.

Using the machinery of CFGs with non-terminals and rules parameterized by suitable attributes as in Lecture 22, construct a grammar for a tiny fragment of English that includes three-word sentences containing a transitive verb, such as:

> She washes herself I wash myself It prepares itself You prepare yourselves He congratulates himself They congratulate themselves

but excludes sentences like

She washes himself It prepares themselves We congratulates ourselves

- 2. Choose a set of constants and predicates suitable for representing the following sentences in first order predicate logic as described in Lecture 24.
 - Jumbo is an elephant.
 - An elephant is a mammal.
 - Every elephant has an owner.
 - Everyone who owns an elephant sings it a song.
 - Only one elephant danced.
 - Every elephant did not dance.

Translate each of these sentences into a formula of FOPL. If you think a sentence is semantically ambiguous, give a first-order formula for each possible interpretation.

3. Consider the following context-free grammar with semantic attachments.

$\{ NP.Sem(VP.Sem) \}$	t
{ IV.Sem }	$\langle e, t \rangle$
$\{\lambda x. \text{NP.Sem}(\text{TV.Sem}(x))\}$	$\langle e, t \rangle$
$\{ Det.Sem(N.Sem) \}$	<< e, t >, t >
$\{ \lambda P.P(John) \}$	<< e, t >, t >
$\{ \lambda P.P(\text{Ice-cream}) \}$	<< e, t >, t >
$\{ \lambda Q.\lambda P. \exists x Q(x) \land P(x) \}$	<< e, t >, << e, t >, t >>
$\{ \lambda Q.\lambda P. \forall x Q(x) \Rightarrow P(x) \}$	<< e, t >, << e, t >, t >>
$\{ \lambda x. \operatorname{cat}(x) \}$	$\langle e, t \rangle$
$\{ \lambda x. ice-cream(x) \}$	$\langle e, t \rangle$
$\{ \lambda x. \operatorname{run}(x) \}$	$\langle e, t \rangle$
$\{ \lambda x.\lambda y. \text{like}(x, y) \}$	< e, < e, t >>
	$ \left\{ \begin{array}{l} \text{NP.Sem}(\text{VP.Sem}) \right\} \\ \left\{ \begin{array}{l} \text{IV.Sem} \right\} \\ \left\{ \begin{array}{l} \lambda x. \text{ NP.Sem}(\text{TV.Sem}(x)) \right\} \\ \left\{ \begin{array}{l} \text{Det.Sem}(\text{N.Sem}) \right\} \\ \left\{ \begin{array}{l} \lambda P.P(John) \right\} \\ \left\{ \begin{array}{l} \lambda P.P(\text{Ice-cream}) \right\} \\ \left\{ \begin{array}{l} \lambda Q.\lambda P. \exists x Q(x) \land P(x) \right\} \\ \left\{ \begin{array}{l} \lambda Q.\lambda P. \forall x Q(x) \Rightarrow P(x) \right\} \\ \left\{ \begin{array}{l} \lambda x. \text{cat}(x) \right\} \\ \left\{ \begin{array}{l} \lambda x. \text{cat}(x) \right\} \\ \left\{ \begin{array}{l} \lambda x. \text{run}(x) \right\} \\ \left\{ \begin{array}{l} \lambda x. \lambda y. \text{like}(x, y) \end{array} \right\} \end{array} \right\} $

Indicate which of the semantic attachments make use of type raising.

Calculate the semantics of the following phrases and sentences, showing explicitly any β -reduction steps used to simplify λ -expressions.

- John runs
- $\bullet\,$ likes ice-cream
- John likes ice-cream
- $\bullet\,$ an ice-cream
- $\bullet\,$ likes an ice-cream
- John likes an ice-cream
- every cat
- every cat likes ice-cream
- every cat likes an ice-cream
