Common Java problems: raw types

```

protected void onCreate(Bundle savedInstanceState) {
    super.onCreate(savedInstanceState);
    setContentView(R.layout.food);
    String[] foodItems = {"Place1", "Place2"};
    setListAdapter(new ArrayAdapter(this, android.R.layout.simple_list_item_1, foodItems));
    getListView().setTextFilterEnabled(true);
}

```

Problems view:

- ArrayAdapter is a raw type. References to generic type ArrayAdapter<T> should be parameterized
- The import android.content.ActivityNotFoundException is never used
- The import android.content.Intent is never used
- The import android.net.Uri is never used
- The import android.util.Log is never used
- The value of the field DBHelper.TAG is not used
- The value of the field ForumActivity.buttonHotel is not used
- Type safety: The constructor ArrayAdapter(Context, int, Object[]) belongs to the raw type ArrayAdapter

Quick fix: a bad suggestion

```

protected void onCreate(Bundle savedInstanceState) {
    super.onCreate(savedInstanceState);
    setContentView(R.layout.food);
    String[] foodItems = {"Place1", "Place2"};
    setListAdapter(new ArrayAdapter(this, android.R.layout.simple_list_item_1, foodItems));
    getListView().setTextFilterEnabled(true);
}

```

Problems view:

- ArrayAdapter is a raw type. References to generic type ArrayAdapter<T> should be parameterized
- The import android.content.ActivityNotFoundException is never used
- The import android.content.Intent is never used
- The import android.net.Uri is never used
- The import android.util.Log is never used
- The value of the field DBHelper.TAG is not used
- The value of the field ForumActivity.buttonHotel is not used
- Type safety: The constructor ArrayAdapter(Context, int, Object[]) belongs to the raw type ArrayAdapter

Quick fix available:
@ Add@SuppressWarnings 'unchecked' to 'onCreate()'

Check the constructor documentation

Problems view:

- android.widget.ArrayAdapter<Context context, int textViewResourceId, T[] objects>

Javadoc view:

What is T?

public android.widget.ArrayAdapter<Context context, int textViewResourceId, T[] objects>
Since API Level 1

Constructor

Parameters

- context The current context.
- textViewResourceId The resource ID for a layout file containing a TextView to use when instantiating views.
- objects The objects to represent in the ListView.

Check the class documentation

Problems view:

- android.widget.ArrayAdapter<T>

T is the generic parameter

A concrete BaseAdapter that is backed by an array of arbitrary objects. By default this class expects that the provided resource id references the constructors that also takes a field id. That field id should reference a TextView in the larger layout resource.

However the TextView is referenced, it will be filled with the toString() of each object in the array. You can add lists or arrays of custom objects that text will be displayed for the item in the list.

To use something other than TextViews for the array display, for instance, ImageViews, or to have some of data besides toString() results fill the type of view you want.

Summary
Inherited Constants
From interface android.widget.Adapter

CS/SE Individual Practical

5 / 24

CS/SE Individual Practical

6 / 24

What type of array are we adapting?

Problems view:

- String[] your.an.android.forum.FoodActivity.onCreate(Bundle).foodItems

In this case, T = String

CS/SE Individual Practical

Errors/Warnings

Select the severity level for the following optional Java compiler problems:

- Non-static access to static member: Warning
- Indirect access to static member: Ignore
- Unqualified access to instance field: Warning (circled)
- Undocumented empty block: Warning (circled)
- Access to a non-accessible member of an enclosing type: Ignore
- Method with a constructor name: Warning (circled)
- Parameter assignment: Ignore
- Non-externalized strings (missing/unused \$NON-NLS\$ tag): Ignore
- Method can be static: Ignore
- Method can potentially be static: Ignore

Potential programming problems

- Name shadowing and conflicts
- Deprecated and restricted API
- Unnecessary code
- Generic type
- Annotations

Include 'assert' in null analysis
 Treat above errors like fatal compiler errors (make compiled code not executable)

Potential programming problems

- Serializable class without serialVersionUID:
- Assignment has no effect (e.g. `x = x`):
- Possible accidental boolean assignment (e.g. `If (a = b)`):
- 'finally' does not complete normally:
- Empty statement:
- Using a char array in string concatenation:
- Hidden catch block:
- Inexact type match for vararg arguments:
- Boxing and unboxing conversions:
- Enum type constant not covered on 'switch':
- 'switch' case fall-through:
- Null pointer access:
- Potential null pointer access:
- Comparing identical values (`x == x`):
- Missing synchronized modifier on inherited method:
- Class overrides 'equals()' but not 'hashCode()':
- Dead code (e.g. `If (false)`):
- Unused object allocation:

Don't forget to add logging ...

public final class Log extends Object

Summary: Constants | Methods | Inherited Methods | [Expand All] Since: API Level 1

java.lang.Object ↗ android.util.Log

Class Overview

API for sending log output.

Generally, use the `Log.v()`, `Log.d()`, `Log.i()`, `Log.w()` and `Log.e()` methods.

The order in terms of verbosity, from least to most is ERROR, WARN, INFO, DEBUG, VERBOSE. Verbose should never be compiled into an application except during development. Debug logs are compiled in but stripped at runtime. Error, warning and info logs are always kept.

Tip: A good convention is to declare a `TAG` constant in your class:

```
private static final String TAG = "MyActivity";
```

and use that in subsequent calls to the log methods.

Tip: Don't forget that when you make a call like

```
Log.v(TAG, "index=" + i);
```
