Literature

- Malik Ghallab, Dana Nau, and Paolo Traverso. *Automated Planning – Theory and Practice*, chapter 13-14. Elsevier/Morgan Kaufmann, 2004.

Why Explicit Time?

- assumption A6: implicit time
 - actions and events have no duration
 - state transitions are instantaneous
- in reality:
 - actions and events do occur over a time span
 - preconditions not only at beginning
 - effects during or even after the action
 - actions may need to maintain partial states
 - events expected to occur in future time periods
 - goals must be achieved within time bound

Temporal Planning

3

Why Explicit Time?

•assumption A6: implicit time

- actions and events have no duration
- state transitions are instantaneous

•in reality:

- actions and events do occur over a time span
- preconditions not only at beginning

- move action: destination must be unoccupied only when robot arrives

•effects during or even after the action

- move action: origin is no longer occupied after robot has left

- paint action: painted effect long after action is completed

•actions may need to maintain partial states

•events expected to occur in future time periods

•goals must be achieved within time bound

Overview

◆ **Actions and Time Points**

◆ now: maintaining consistency in a network of related time points

• **Interval Algebra and Quantitative Time**

• **Planning with Temporal Operators**

Time

- mathematical structure:
 - set with transitive, asymmetric ordering operation
 - discrete, dense, or continuous
 - bounded or unbounded
 - totally ordered or branching
- temporal references:
 - time points (represented by real numbers)
 - time intervals (pair of real numbers)
- temporal relations:
 - examples: before, during

Temporal Planning

5

Time

- **mathematical structure:**
 - **set with transitive, asymmetric ordering operation**
 - **discrete, dense, or continuous**
 - **bounded or unbounded**
 - **totally ordered or branching**
- **temporal references:**
 - **time points (represented by real numbers)**
 - **time intervals (pair of real numbers)**
- **temporal relations:**
 - **examples: before, during**

Causal vs. Temporal Analysis of Actions

- example: `load(crane2, cont5, robot1, interval6)`
- causal analysis (what propositions hold?):
 - what propositions will change (effects)
 - what propositions are required (preconditions)
- temporal analysis (when propositions hold?):
 - when other, related assertions can/cannot be true
 - reason over:
 - time periods during which propositions must hold
 - time points at which values of state variables change

Temporal Planning

6

Causal vs. Temporal Analysis of Actions

- example: `load(crane2, cont5, robot1, interval6)`
- causal analysis (what propositions hold?):
 - what propositions will change (effects)
 - what propositions are required (preconditions)
- temporal analysis (when propositions hold?):
 - when other, related assertions can/cannot be true
 - reason over:
 - time periods during which propositions must hold
 - time points at which values of state variables change

Temporal Databases

- maintain temporal references for every domain proposition
 - when does it hold
 - when does it change value
- functionality:
 - assert new temporal relations
 - querying whether temporal relation holds
 - check for consistency
- planner attempts to assert relations among temporal references

Temporal Planning

7

Temporal Databases

- maintain temporal references for every domain proposition
 - when does it hold
 - when does it change value
- functionality:
 - assert new temporal relations
 - querying whether temporal relation holds
 - check for consistency
- planner attempts to assert relations among temporal references
 - planner uses temporal database like ordering constraints

Temporal References Example: Container Loading

- load container *c* onto robot *r* at location *l*
- t_1 : instant at which robot *r* enters location *l*
- t_2 : instant at which robot *r* stops at location *l*
 - $i_1=[t_1, t_2]$: interval corresponding to *r entering l*
- t_3 : instant at which the crane starts picking up *c*
- t_4 : instant at which crane finishes putting *c* on *r*
 - $i_2=[t_3, t_4]$: interval corresponding to *picking up and loading c*
- t_5 : instant at which *c* begins to be loaded onto *r*
- t_6 : instant at which *c* is no longer loaded onto *r*
 - $i_3=[t_5, t_6]$: interval corresponding to *c being loaded onto r*

Temporal Planning

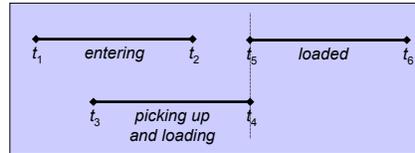

8

Temporal References Example: Container Loading

- load container *c* onto robot *r* at location *l*
 - t_1 : instant at which robot *r* enters location *l*
 - t_2 : instant at which robot *r* stops at location *l*
 - $i_1=[t_1, t_2]$: interval corresponding to *r entering l*
 - t_3 : instant at which the crane starts picking up *c*
 - t_4 : instant at which crane finishes putting *c* on *r*
 - $i_2=[t_3, t_4]$: interval corresponding to *picking up and loading c*
 - t_5 : instant at which *c* begins to be loaded onto *r*
 - t_6 : instant at which *c* is no longer loaded onto *r*
 - $i_3=[t_5, t_6]$: interval corresponding to *c being loaded onto r*
- instants $t_1 \dots t_6$ and intervals $i_1 \dots i_3$ are temporal references that specify when domain propositions are true
- may use just the intervals in this example
 - intervals i_1 and i_2 refer to activities taking place, i_3 refers to a proposition holding

Temporal Relations Example: Container Loading

- assumption: crane is allowed to pick up container as soon as robot has entered location
- possible temporal sequences:
 - $t_1 < t_3 < t_2 < t_4 = t_5 < t_6$ (see figure) or
 - $t_1 = t_3$ or $t_2 = t_3$ or $t_2 < t_3$

Temporal Planning

9

Temporal Relations Example: Container Loading

•assumption: crane is allowed to pick up container as soon as robot has entered location

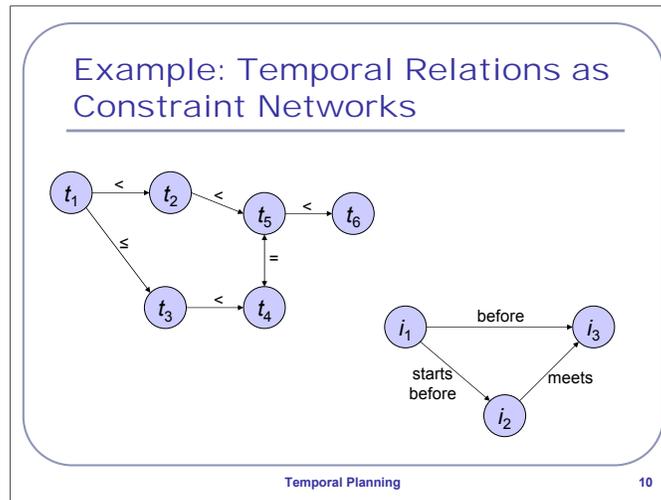

•possible temporal sequences:

• $t_1 < t_3 < t_2 < t_4 = t_5 < t_6$ (see figure) or

• $t_1 = t_3$ or $t_2 = t_3$ or $t_2 < t_3$

•[figure]

•no absolute information about durations or time positions, only binary constraints between instants or intervals

Example: Temporal Relations as Constraint Networks

- top left: instant constraint network
 - variables: instants / domains: real numbers
 - relations: $<$, $=$, \leq , ... (relative positions of time points)
- bottom right: interval constraint network
 - variables: intervals / domains: $\mathbb{R} \times \mathbb{R}$
 - relations: before, starts before, ... (relative positions of intervals)

Point Algebra (PA): Relations and Constraints

- possible primitive relations P between instants t_1 and t_2 : $P = \{<, =, >\}$
 - t_1 before t_2 : $[t_1 < t_2]$
 - t_1 equal to t_2 : $[t_1 = t_2]$
 - t_1 after t_2 : $[t_1 > t_2]$
- possible qualitative constraints R between instants:
 - sets of the above relations (interpret as disjunction)
 - $R = 2^P = \{\emptyset, \{<\}, \{=\}, \{>\}, \{<, =\}, \{<, >\}, \{=, >\}, P\}$

Temporal Planning

11

Point Algebra (PA): Relations and Constraints

• possible primitive relations P between instants t_1 and t_2 : $P = \{<, =, >\}$

• t_1 before t_2 : $[t_1 < t_2]$

• t_1 equal to t_2 : $[t_1 = t_2]$

• t_1 after t_2 : $[t_1 > t_2]$

• possible qualitative constraints R between instants:

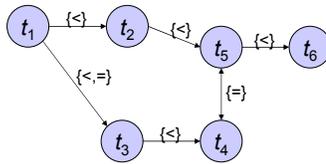

• sets of the above relations (interpret as disjunction)

• $R = 2^P = \{\emptyset, \{<\}, \{=\}, \{>\}, \{<, =\}, \{<, >\}, \{=, >\}, P\}$

• empty set: no alternatives cannot be satisfied

• P : all possible relations; always satisfied

Container Loading Example: PA Constraints

- $[t_1 \{<\} t_2]$
- $[t_1 \{<,=\} t_3]$
- $[t_2 \{<\} t_5]$
- $[t_3 \{<\} t_4]$
- $[t_4 \{=\} t_5]$
- $[t_5 \{=\} t_4]$
- $[t_5 \{<\} t_6]$

Temporal Planning

12

Container Loading Example: PA Constraints

•[figure]

• $[t_1 \{<\} t_2]$

• $[t_1 \{<,=\} t_3]$

• $[t_2 \{<\} t_5]$

• $[t_3 \{<\} t_4]$

• $[t_4 \{=\} t_5]$

• $[t_5 \{=\} t_4]$

• $[t_5 \{<\} t_6]$

PA: Combining Constraints

- usual set operations:

- \cap , \cup etc.

- composition (noted \bullet):

- let $r, q \in R$
- if $[t_1 r t_2]$ and $[t_2 q t_3]$
- then $[t_1 r \bullet q t_3]$
- $r \bullet q$ as defined in composition table

•	<	=	>
<	<	<	P
=	<	=	>
<	P	>	>

PA composition table

PA: Combining Constraints

- usual set operations:

- \cap , \cup etc.

- composition (noted \bullet):

- composition operator handles transitivity

- let $r, q \in R$

- if $[t_1 r t_2]$ and $[t_2 q t_3]$

- then $[t_1 r \bullet q t_3]$

- $r \bullet q$ as defined in composition table

- [composition table]

PA: Properties of Combined Constraints

- distributive
 - $(r \cup q) \bullet s = (r \bullet s) \cup (q \bullet s)$
 - $s \bullet (r \cup q) = (s \bullet r) \cup (s \bullet q)$
- symmetrical constraint r' of r
 - $[t_1 r t_2]$ iff $[t_2 r' t_1]$
 - obtained by replacing in r : $<$ with $>$ and vice versa
 - $(r \bullet q)' = q' \bullet r'$
- (R, \cup, \bullet) is an algebra:
 - R is closed under \cup and \bullet
 - \cup is an associative and commutative operation
 - identity element for \cup is \emptyset
 - \bullet is an associative operation
 - identity element for \bullet is $\{=\}$

Temporal Planning

14

PA: Properties of Combined Constraints

•distributive

$$\bullet(r \cup q) \bullet s = (r \bullet s) \cup (q \bullet s)$$

$$\bullet s \bullet (r \cup q) = (s \bullet r) \cup (s \bullet q)$$

•symmetrical constraint r' of r :

$$\bullet[t_1 r t_2] \text{ iff } [t_2 r' t_1]$$

•obtained by replacing in r : $<$ with $>$ and vice versa

$$\bullet(r \bullet q)' = q' \bullet r'$$

• (R, \cup, \bullet) is an algebra:

• R is closed under \cup and \bullet

• \cup is an associative and commutative operation

•identity element for \cup is \emptyset

• \bullet is an associative operation

•identity element for \bullet is $\{=\}$

PA: Constraint Propagation

```

graph TD
    t1((t1)) -- r --> t2((t2))
    t1 -- q --> t3((t3))
    t3 -- s --> t2
    t1 -.- "q*s" -.- t2
  
```

- given constraints:
 - $[t_1 r t_2]$
 - $[t_1 q t_3]$
 - $[t_3 s t_2]$
- implied constraint:
 - $[t_1 r \cap q \cdot s t_2]$
- inconsistency:
 - if $r \cap q \cdot s = \emptyset$

Temporal Planning 15

PA: Constraint Propagation

•given constraints:

• $[t_1 r t_2]$

• $[t_1 q t_3]$

• $[t_3 s t_2]$

•implied constraint:

• $[t_1 r \cap q \cdot s t_2]$

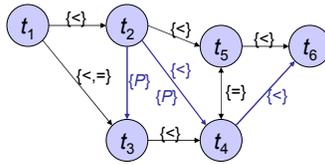

•important operation: intersection, not union (algebra for union)

•inconsistency:

•if $r \cap q \cdot s = \emptyset$

•necessary condition!

Container Loading Example: Constraint Propagation

- path: $t_4-t_5-t_6$: $[t_4=t_5]$ • $[t_5<t_6]$ implies $[t_4<t_6]$
 - path: $t_2-t_1-t_3$: $[t_2>t_1]$ • $[t_1\leq t_6]$ implies $[t_2Pt_3]$
 - path: $t_2-t_5-t_4$: $[t_2<t_5]$ • $[t_5=t_4]$ implies $[t_2<t_4]$
 - path: $t_2-t_3-t_4$: $[t_2Pt_3]$ • $[t_3<t_4]$ implies $[t_2Pt_4]$
- } $[t_2<t_4]$

Temporal Planning

16

Container Loading Example: Constraint Propagation

- path: $t_4-t_5-t_6$: $[t_4=t_5]$ • $[t_5<t_6]$ implies $[t_4<t_6]$
- path: $t_2-t_1-t_3$: $[t_2>t_1]$ • $[t_1\leq t_6]$ implies $[t_2Pt_3]$
- path: $t_2-t_5-t_4$: $[t_2<t_5]$ • $[t_5=t_4]$ implies $[t_2<t_4]$
- path: $t_2-t_3-t_4$: $[t_2Pt_3]$ • $[t_3<t_4]$ implies $[t_2Pt_4]$
- last two give: $[t_2<t_4]$

PA Constraint Networks

- A binary PA constraint network is a directed graph (X,C) , where:
 - $X = \{t_1, \dots, t_n\}$ is a set of instant variables (nodes), and
 - $C \subseteq X \times X$ (the edges), c_{ij} is labelled by a constraint $r_{ij} \in R$ iff $[t_i, r_{ij}, t_j]$ holds.
- A tuple $\langle v_1, \dots, v_k \rangle$ of real numbers is a solution for (X,C) iff $t_i = v_i$ satisfy all the constraints in C .
- (X,C) is consistent iff there exists at least one solution.

Temporal Planning

17

PA Constraint Networks

• A binary PA constraint network is a directed graph (X,C) , where:

- $X = \{t_1, \dots, t_n\}$ is a set of instant variables (nodes), and
- $C \subseteq X \times X$ (the edges), c_{ij} is labelled by a constraint $r_{ij} \in R$ iff $[t_i, r_{ij}, t_j]$ holds.

- if $c_{ij} \in C$ labelled with $r_{ij} \in R$ then c_{ji} must be labelled with the symmetric constraint r_{ij}'

- if there is no $c_{ij} \in C$ then we can add c_{ij} labelled with $r_{ij} = P$

• A tuple $\langle v_1, \dots, v_k \rangle$ of real numbers is a solution for (X,C) iff $t_i = v_i$ satisfy all the constraints in C .

• (X,C) is consistent iff there exists at least one solution.

Primitives in Consistent Networks

- **Proposition:** A PA network (X,C) is consistent iff
 - there is a set of primitives $p_{ij} \in r_{ij}$ for every $c_{ij} \in C$ such that
 - for every k : $p_{ij} \in (p_{ik} \bullet p_{kj})$
- note: not interested in solution, just consistency (qualitative solution)

Temporal Planning

18

Primitives in Consistent Networks

- **Proposition:** A PA network (X,C) is consistent iff
 - there is a set of primitives $p_{ij} \in r_{ij}$ for every $c_{ij} \in C$ such that
 - for every k : $p_{ij} \in (p_{ik} \bullet p_{kj})$
 - note: in a solution every pair t_i, t_j will be related by a single primitive relation $p_{ij} \in r_{ij}$
- note: not interested in solution, just consistency (qualitative solution)

Redundant Networks

- A primitive $p_{ij} \in r_{ij}$ is redundant if there is no solution in which $[t_i, p_{ij}, t_j]$ holds.
- idea: filter out redundant primitives until
 - either: no more redundant primitives can be found
 - or: we find a constraint that is reduced to \emptyset (inconsistency)

Temporal Planning

19

Redundant Networks

- A primitive $p_{ij} \in r_{ij}$ is redundant if there is no solution in which $[t_i, p_{ij}, t_j]$ holds.
- idea: filter out redundant primitives until
 - either: no more redundant primitives can be found
 - or: we find a constraint that is reduced to \emptyset (inconsistency)
- use path consistency algorithm for CSP problems

Path Consistency: Pseudo Code

```
pathConsistency(C)
  while  $\neg$ C.isStable() do
    for each  $k : 1 \leq k \leq n$  do
      for each pair  $i, j : 1 \leq i < j \leq n, i \neq k, j \neq k$  do
         $c_{ij} \leftarrow c_{ij} \cap [c_{ik} \bullet c_{kj}]$ 
        if  $c_{ij} = \emptyset$  then return inconsistent
```

Temporal Planning

20

Path Consistency: Pseudo Code

•pathConsistency(C)

- given time point network

•while \neg C.isStable() do

•for each $k : 1 \leq k \leq n$ do

- “middle node”

•for each pair $i, j : 1 \leq i < j \leq n, i \neq k, j \neq k$ do

- surrounding nodes

• $c_{ij} \leftarrow c_{ij} \cap [c_{ik} \bullet c_{kj}]$

- update direct link using transitivity property

•if $c_{ij} = \emptyset$ then return inconsistent

- use as constraint manager during planning: incremental version of the algorithm

Path Consistency: Properties

- algorithm $\text{pathConsistency}(C)$ is:
 - incomplete for general CSPs
 - complete for PA networks
- network (X,C) is minimal if it has no redundant primitives in a constraint
- algorithm $\text{pathConsistency}(C)$ does not guarantee a minimal network

Temporal Planning

21

Path Consistency: Properties

- algorithm $\text{pathConsistency}(C)$ is:
 - incomplete for general CSPs
 - complete for PA networks
- network (X,C) is minimal if it has no redundant primitives in a constraint
- algorithm $\text{pathConsistency}(C)$ does not guarantee a minimal network

Overview

- **Interval Algebra and Quantitative Time**
- Planning with Temporal Operators

Temporal Planning

22

Overview

➔ Actions and Time Points

➔ just done: maintaining consistency in a network of related time points

• Interval Algebra and Quantitative Time

• now: reasoning about more complex structures

• Planning with Temporal Operators

Extended Example: Inspect and Seal

- every container must be inspected and sealed:
- inspection:
 - carried out by the crane
 - must be performed *before or after* loading
- sealing:
 - carried out by robot
 - *before or after* unloading, not while moving
- corresponding intervals:
 - $i_{load}, i_{move}, i_{unload}, i_{inspect}, i_{seal}$

Temporal Planning

23

Extended Example: Inspect and Seal

•every container must be inspected and sealed:

•inspection:

•carried out by the crane

•must be performed *before or after* loading

•sealing:

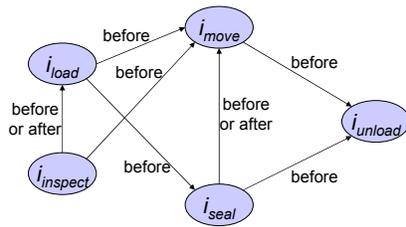

•carried out by robot

•*before or after* unloading, not while moving

•corresponding intervals:

• $i_{load}, i_{move}, i_{unload}, i_{inspect}, i_{seal}$

Inspect and Seal Example: Interval Constraint Network

Temporal Planning

24

Inspect and Seal Example: Interval Constraint Network

- “before or after” = must not overlap

Inspect and Seal Example: Qualitative Instant Constraints

- Let i be an interval.
 - $i.b$ and $i.e$ denote two end time points
 - $[i.b \leq i.e]$ constraint: beginning before end
- $[i_{load}$ before $i_{move}]$:
 - $[i_{load}.b \leq i_{load}.e]$ and $[i_{move}.b \leq i_{move}.e]$ and
 - $[i_{load}.e < i_{move}.b]$
- $[i_{move}$ before-or-after $i_{seal}]$:
 - $[i_{move}.e < i_{seal}.b]$ or
 - $[i_{seal}.e < i_{move}.b]$

disjunction cannot be translated into binary PA constraint

Temporal Planning

25

Inspect and Seal Example: Qualitative Instant Constraints

• Let i be an interval.

• $i.b$ and $i.e$ denote two end time points

• $[i.b \leq i.e]$ constraint: beginning before end

• $[i_{load}$ before $i_{move}]$:

• $[i_{load}.b \leq i_{load}.e]$ and $[i_{move}.b \leq i_{move}.e]$ and

• $[i_{load}.e < i_{move}.b]$

• $[i_{move}$ before-or-after $i_{seal}]$:

• $[i_{move}.e < i_{seal}.b]$ or

• $[i_{seal}.e < i_{move}.b]$

• disjunction cannot be translated into binary PA constraint

• translation of interval constraint network into (binary) instant constraint network not possible in general

Interval Algebra (IA): Relations

<ul style="list-style-type: none"> • i_1 before i_2: [i_1 b i_2]  <ul style="list-style-type: none"> • i_1 meets i_2: [i_1 m i_2]  <ul style="list-style-type: none"> • i_1 overlaps i_2: [i_1 o i_2] 	<ul style="list-style-type: none"> • i_1 starts i_2: [i_1 s i_2]  <ul style="list-style-type: none"> • i_1 during i_2: [i_1 d i_2]  <ul style="list-style-type: none"> • i_1 finishes i_2: [i_1 f i_2] 
--	---

Temporal Planning 26

Interval Algebra (IA): Relations

- interval algebra: similar to point algebra, but related objects are intervals

IA: Relations and Constraints

- possible primitive relations P between intervals i_1 and i_2 :
 - just described: $[i_1 b i_2], [i_1 m i_2], [i_1 o i_2], [i_1 s i_2], [i_1 d i_2], [i_1 f i_2]$
 - symmetrical: $[i_1 b' i_2], [i_1 m' i_2], [i_1 o' i_2], [i_1 s' i_2], [i_1 d' i_2], [i_1 f' i_2]$
 - i_1 equals i_2 : $[i_1 e i_2]$

- possible qualitative constraints R between instants:
 - sets of the above relations (interpret as disjunction)
 - $R = 2^P = \{\emptyset, \{b\}, \{m\}, \{o\}, \dots, \{b,m\}, \{b,o\}, \dots, \{b,m,o\}, \dots, P\}$
 - examples: while = $\{s,d,f\}$; disjoint = $\{b,b\}$

Temporal Planning

27

IA: Relations and Constraints

• possible primitive relations P between intervals i_1 and i_2 :

- just described: $[i_1 b i_2], [i_1 m i_2], [i_1 o i_2], [i_1 s i_2], [i_1 d i_2], [i_1 f i_2]$
- symmetrical: $[i_1 b' i_2], [i_1 m' i_2], [i_1 o' i_2], [i_1 s' i_2], [i_1 d' i_2], [i_1 f' i_2]$
- i_1 equals i_2 : $[i_1 e i_2]$

• 13 possible ways of relating the two end points

• possible qualitative constraints R between instants:

• sets of the above relations (interpret as disjunction)

• $R = 2^P = \{\emptyset, \{b\}, \{m\}, \{o\}, \dots, \{b,m\}, \{b,o\}, \dots, \{b,m,o\}, \dots, P\}$

• constraints: 2^{13} possible constraints

• empty set: no alternatives cannot be satisfied

• P : all possible relations; always satisfied

• examples: while = $\{s,d,f\}$; disjoint = $\{b,b\}$

Operations on Relations

- set operations: \cap , \cup etc.
- composition: \circ

\circ	b	m	o	s	d	f	b'	d'	f'
b	b	b	b	b	uv	uv	P	b	b
m	b	b	b	m	v	v	$u'v'$	b	b
o	b	b	u	o	v	v	$u'v'$	$u'w'$	u
s	b	b	u	s	d	d	b'	$u'w'$	u
d	b	b	uv	d	d	d	b'	P	uv

Temporal Planning

28

Operations on Relations

•set operations: \cap , \cup etc.

•composition: \circ

•[table]

• $u=\{b,m,o\}$; $v=\{o,s,d\}$; $w=\{d,f\}$

•composition is transitive and distributive

Properties of Composition

- transitive
 - if $[i_1 r i_2]$ and $[i_2 q i_3]$ then $[i_1 (r \cdot q) i_3]$
- distributive
 - $(r \cup q) \cdot s = (r \cdot s) \cup (q \cdot s)$
 - $s \cdot (r \cup q) = (s \cdot r) \cup (s \cdot q)$
- not commutative
 - $[i_1 (r \cdot q) i_2]$ does not imply $[i_1 (q \cdot r) i_2]$
 - example: $d \cdot b = \{b\}$; $b \cdot d = \{b, m, o, s, d\}$

Temporal Planning 29

Properties of Composition

•transitive

•if $[i_1 r i_2]$ and $[i_2 q i_3]$ then $[i_1 (r \cdot q) i_3]$

•distributive

• $(r \cup q) \cdot s = (r \cdot s) \cup (q \cdot s)$

• $s \cdot (r \cup q) = (s \cdot r) \cup (s \cdot q)$

•not commutative

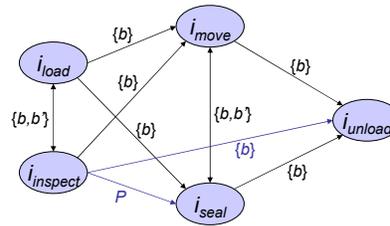

• $[i_1 (r \cdot q) i_2]$ does not imply $[i_1 (q \cdot r) i_2]$

•example: $d \cdot b = \{b\}$; $b \cdot d = \{b, m, o, s, d\}$

•[figure]

•for $[i_1 (b \cdot d) i_3]$: i_3 could start before, at the same time as, during, at the end of, or after i_2

Inspect and Seal Example: Interval Constraint Propagation

- $i_{inspect}-i_{move}-i_{unload}$: $[i_{inspect} \{b\} \cdot \{b\} i_{unload}] = [i_{inspect} \{b\} i_{unload}]$
- $i_{inspect}-i_{load}-i_{seal}$: $[i_{inspect} \{b,b\} \cdot \{b\} i_{seal}] = [i_{inspect} P i_{seal}]$

Temporal Planning

30

Inspect and Seal Example: Interval Constraint Propagation

•[figure]

• $i_{inspect}-i_{move}-i_{unload}$: $[i_{inspect} \{b\} \cdot \{b\} i_{unload}] = [i_{inspect} \{b\} i_{unload}]$

• $i_{inspect}-i_{load}-i_{seal}$: $[i_{inspect} \{b,b\} \cdot \{b\} i_{seal}] = [i_{inspect} P i_{seal}]$

IA Constraint Networks

- A binary IA constraint network is a directed graph (X,C) , where:
 - $X = \{i_1, \dots, i_n\}$ is a set of interval variables $i_j = (i_j.b, i_j.e)$, where $i_j.b \leq i_j.e$, and
 - $C \subseteq X \times X$ (the edges), c_{ij} is labelled by a constraint $r_{ij} \in R$ iff $[i_j, r_{ij} i_j]$ holds.
- A tuple $\langle v_1, \dots, v_k \rangle$ of pairs of real numbers $(v_i.b, v_i.e)$ is a solution for (X,C) iff $v_i.b \leq v_i.e$ $i_j = v_j$ satisfy all the constraints in C .
- (X,C) is consistent iff there exists at least one solution.

Temporal Planning

31

IA Constraint Networks

• A binary IA constraint network is a directed graph (X,C) , where:

• $X = \{i_1, \dots, i_n\}$ is a set of interval variables $i_j = (i_j.b, i_j.e)$, where $i_j.b \leq i_j.e$, and

• domain of each interval variable is a half plane due to $i_j.b \leq i_j.e$

• $C \subseteq X \times X$ (the edges), c_{ij} is labelled by a constraint $r_{ij} \in R$ iff $[i_j, r_{ij} i_j]$ holds.

• A tuple $\langle v_1, \dots, v_k \rangle$ of pairs of real numbers $(v_i.b, v_i.e)$ is a solution for (X,C) iff $v_i.b \leq v_i.e$ $i_j = v_j$ satisfy all the constraints in C .

• (X,C) is consistent iff there exists at least one solution.

Primitives in Consistent Networks

- **Proposition:** A IA network (X,C) is consistent iff
 - there is a set of primitives $p_{ij} \in r_{ij}$ for every $c_{ij} \in C$ such that
 - for every $k: p_{ij} \in (p_{ik} \bullet p_{kj})$
- idea: filter out redundant primitives using path consistency algorithm until
 - either: no more redundant primitives can be found
 - or: we find a constraint that is reduced to \emptyset (inconsistency)
- note: path consistency not complete for IA networks

Temporal Planning

32

Primitives in Consistent Networks

•**Proposition:** A IA network (X,C) is consistent iff

•there is a set of primitives $p_{ij} \in r_{ij}$ for every $c_{ij} \in C$ such that

•for every $k: p_{ij} \in (p_{ik} \bullet p_{kj})$

•idea: filter out redundant primitives using path consistency algorithm until

•either: no more redundant primitives can be found

•or: we find a constraint that is reduced to \emptyset (inconsistency)

•note: path consistency not complete for IA networks

•consistency checking for IP networks is an NP-complete problem

Example: Quantitative Temporal Relations

- ship: Uranus
 - arrives within 1 or 2 days
 - will leave either with
 - light cargo (stay docked 3 to 4 days) or
 - full load (stay docked at least six days)
- ship: Rigel
 - to be serviced on
 - express dock (stay docked 2 to 3 days)
 - normal dock (stay docked 4 to 5 days)
 - must depart 6 to 7 days from now
- Uranus must depart 1 to 2 days after Rigel arrives

Temporal Planning

33

Example: Quantitative Temporal Relations

•ship: Uranus

•arrives within 1 or 2 days

•will leave either with

•light cargo (stay docked 3 to 4 days) or

•full load (stay docked at least six days)

•ship: Rigel

•to be serviced on

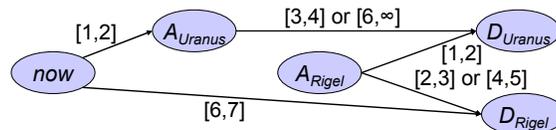

•express dock (stay docked 2 to 3 days)

•normal dock (stay docked 4 to 5 days)

•must depart 6 to 7 days from now

•Uranus must depart 1 to 2 days after Rigel arrives

Example: Quantitative Temporal Constraint Network

- 5 instants related by quantitative constraints
 - e.g. $(2 \leq D_{Rigel} - A_{Rigel} \leq 3) \vee (4 \leq D_{Rigel} - A_{Rigel} \leq 5)$
- possible questions:
 - When should the Rigel arrive?
 - Can it be serviced on a normal dock?
 - Can the Uranus take a full load?

Temporal Planning

34

Example: Quantitative Temporal Constraint Network

•5 instants related by quantitative constraints

•e.g. $(2 \leq D_{Rigel} - A_{Rigel} \leq 3) \vee (4 \leq D_{Rigel} - A_{Rigel} \leq 5)$

•possible questions:

•When should the Rigel arrive?

•Can it be serviced on a normal dock?

•Can the Uranus take a full load?

Overview

- Actions and Time Points
- Interval Algebra and Quantitative Time
- **Planning with Temporal Operators**

Overview

➤ Actions and Time Points

• Interval Algebra and Quantitative Time

- just done: reasoning about more complex structures

• Planning with Temporal Operators

- now: integrating reasoning about time into a planning algorithm

Temporally Qualified Expressions (*tqe*)

- ***tqe***: expression of the form:
 $p(o_1, \dots, o_k)@[t_b, t_e[$
where:
 - p is a flexible relation in the planning domain,
 - o_1, \dots, o_k are object constants or variables, and
 - t_b, t_e are temporal variables such that $t_b < t_e$.
- ***tqe*** $p(o_1, \dots, o_k)@[t_b, t_e[$ asserts that:
 - for every time point t : $t_b \leq t < t_e$ implies that $p(o_1, \dots, o_k)$ holds
 - $[t_b, t_e[$ is semi-open to avoid inconsistencies

Temporal Planning

36

Temporally Qualified Expressions (*tqe*)

• ***tqe***: expression of the form:

$$p(o_1, \dots, o_k)@[t_b, t_e[$$

where:

- **p is a flexible relation in the planning domain,**
- **o_1, \dots, o_k are object constants or variables, and**
 - object constants: objects in the planning domain: robots, containers, etc.
 - object variables: (possibly typed) variables with object constants as possible values
- **t_b, t_e are temporal variables such that $t_b < t_e$.**
- ***tqe*** $p(o_1, \dots, o_k)@[t_b, t_e[$ asserts that:
 - for every time point t : $t_b \leq t < t_e$ implies that $p(o_1, \dots, o_k)$ holds
 - **$[t_b, t_e[$ is semi-open to avoid inconsistencies**
 - semi-open interval:
 - asserted relation holds at t_b , but not at t_e
 - suppose two *tqes* with inconsistent relations meet at time point t ; inconsistency at t !

Temporal Database

- A temporal database is a pair $\Phi=(\mathcal{T},\mathcal{C})$ where:
 - \mathcal{T} is a finite set of *tges*,
 - \mathcal{C} is a finite set of temporal and object constraints, and
 - \mathcal{C} has to be consistent, i.e. there exist possible values for the variables that meet all the constraints.

Temporal Planning

37

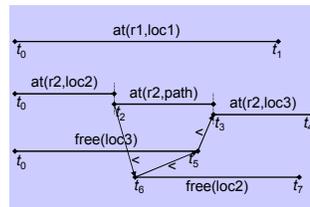

Temporal Database

• A temporal database is a pair $\Phi=(\mathcal{T},\mathcal{C})$ where:

- Φ - phi
- \mathcal{T} is a finite set of *tges*,
- \mathcal{C} is a finite set of temporal and object constraints, and
 - temporal constraints: see time point algebra
 - object constraints: rigid relations
- \mathcal{C} has to be consistent, i.e. there exist possible values for the variables that meet all the constraints.

Temporal Database: Example

- robot r1 is at location loc1
- robot r2 moves from location loc2 to location loc3

$\Phi = \{$
 $\text{at}(r1,loc1)@[t_0,t_1[,$
 $\text{at}(r2,loc2)@[t_0,t_2[,$
 $\text{at}(r2,path)@[t_2,t_3[,$
 $\text{at}(r2,loc3)@[t_3,t_4[,$
 $\text{free}(loc3)@[t_0,t_5[,$
 $\text{free}(loc2)@[t_6,t_7[},$
 $\{ \text{adjacent}(loc2,loc3),$
 $t_2 < t_6 < t_5 < t_3 \}$

Temporal Planning

38

Temporal Database: Example

- robot r1 is at location loc1
- robot r2 moves from location loc2 to location loc3
- [figure]
- $\Phi = ($
 - {at(r1,loc1)@[t₀,t₁[, at(r2,loc2)@[t₀,t₂[, at(r2,path)@[t₂,t₃[, at(r2,loc3)@[t₃,t₄[, free(loc3)@[t₀,t₅[, free(loc2)@[t₆,t₇[},
 - {adjacent(loc2,loc3), t₂<t₆<t₅<t₃ }

Inference over *tqes*

- A set \mathcal{Z} of *tqes* supports a (single) *tqe* $e=p(v_1, \dots, v_k)@[t_b, t_e[$ iff:
 - there is a *tqe* $p(o_1, \dots, o_k)@[t_1, t_2[$ in \mathcal{Z} and
 - there is a substitution σ such that:
 - $\sigma(p(v_1, \dots, v_k)) = p(o_1, \dots, o_k)$.
- An enabling condition for e in \mathcal{Z} is the conjunction of the following constraints:
 - $t_1 \leq t_b, t_e \leq t_2$ and
 - the variable binding constraints in σ .

Temporal Planning

39

Inference over *tqes*

• A set \mathcal{Z} of *tqes* supports a (single) *tqe* $e=p(v_1, \dots, v_k)@[t_b, t_e[$ iff:

• there is a *tqe* $p(o_1, \dots, o_k)@[t_1, t_2[$ in \mathcal{Z} and

• there is a substitution σ such that:

$$\bullet \sigma(p(v_1, \dots, v_k)) = p(o_1, \dots, o_k).$$

• An enabling condition for e in \mathcal{Z} is the conjunction of the following constraints:

• $t_1 \leq t_b, t_e \leq t_2$ and

• the variable binding constraints in σ .

• note: if $p(o_1, \dots, o_k)$ holds during $[t_1, t_2[$ it must also hold over any sub-interval

Inference over *tges*: Example

- $\mathcal{F} = \{ \text{at}(r1, \text{loc1})@[t_0, t_1[, \text{at}(r2, \text{loc2})@[t_0, t_2[,$
 $\text{at}(r2, \text{path})@[t_2, t_3[, \text{at}(r2, \text{loc3})@[t_3, t_4[,$
 $\text{free}(\text{loc3})@[t_0, t_5[, \text{free}(\text{loc2})@[t_6, t_7[} \}$
- \mathcal{F} supports $\text{free}(l)@[t, t[$
- with enabling conditions:
 - $t_0 \leq t, t' \leq t_5, \text{ and } l \neq \text{loc3}, \text{ or}$
 - $t_6 \leq t, t' \leq t_7, \text{ and } l \neq \text{loc2}.$

Temporal Planning

40

Inference over *tges*: Example

• $\mathcal{F} = \{ \text{at}(r1, \text{loc1})@[t_0, t_1[, \text{at}(r2, \text{loc2})@[t_0, t_2[, \text{at}(r2, \text{path})@[t_2, t_3[,$
 $\text{at}(r2, \text{loc3})@[t_3, t_4[, \text{free}(\text{loc3})@[t_0, t_5[, \text{free}(\text{loc2})@[t_6, t_7[} \}$

• \mathcal{F} supports $\text{free}(l)@[t, t'[$

• with enabling conditions:

• $t_0 \leq t, t' \leq t_5, \text{ and } l \neq \text{loc3}, \text{ or}$

• $t_6 \leq t, t' \leq t_7, \text{ and } l \neq \text{loc2}.$

• note: enabling conditions are not necessarily unique

Inference over Sets of *tqes*

- A set \mathcal{F} of *tqes* supports a set \mathcal{E} of *tqes* iff:
 - there is a substitution σ such that:
 - \mathcal{F} supports every *tqe* $e \in \mathcal{E}$ using substitution σ .
- The set of enabling conditions for a single *tqe* e in \mathcal{F} is denoted $\Theta(e/\mathcal{F})$.
- The set of enabling conditions for a set of *tqes* \mathcal{E} in \mathcal{F} is denoted $\Theta(\mathcal{E}/\mathcal{F})$.

Temporal Planning

41

Inference over Sets of *tqes*

• A set \mathcal{F} of *tqes* supports a set \mathcal{E} of *tqes* iff:

• there is a substitution σ such that:

• \mathcal{F} supports every *tqe* $e \in \mathcal{E}$ using substitution σ .

• The set of enabling conditions for a single *tqe* e in \mathcal{F} is denoted $\Theta(e/\mathcal{F})$.

• The set of enabling conditions for a set of *tqes* \mathcal{E} in \mathcal{F} is denoted $\Theta(\mathcal{E}/\mathcal{F})$.

• Θ = theta

Inference over Temporal Databases

- A temporal database $\Phi=(\mathcal{T},\mathcal{C})$ supports a set \mathcal{E} of *tqes* iff:
 - \mathcal{T} supports \mathcal{E} and
 - there is an enabling condition $c \in \Theta(\mathcal{E}/\mathcal{T})$ that is consistent with \mathcal{C} .
- A temporal database $\Phi=(\mathcal{T},\mathcal{C})$ supports another temporal database $\Phi'=(\mathcal{T}',\mathcal{C}')$ iff:
 - \mathcal{T} supports \mathcal{T}' and
 - there is an enabling condition $c \in \Theta(\mathcal{T}'/\mathcal{T})$ such that
 - \mathcal{C}' is consistent with \mathcal{C} .
- A temporal database $\Phi=(\mathcal{T},\mathcal{C})$ entails another temporal database $\Phi'=(\mathcal{T}',\mathcal{C}')$ iff:
 - \mathcal{T} supports \mathcal{T}' and
 - there is an enabling condition $c \in \Theta(\mathcal{T}'/\mathcal{T})$ such that
 - \mathcal{C} entails \mathcal{C}' .

Temporal Planning

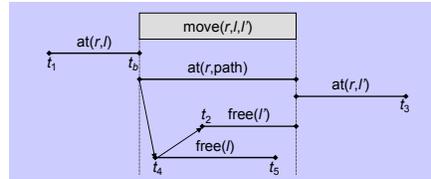

42

Inference over Temporal Databases

- A temporal database $\Phi=(\mathcal{T},\mathcal{C})$ supports a set \mathcal{E} of *tqes* iff:
 - \mathcal{T} supports \mathcal{E} and
 - there is an enabling condition $c \in \Theta(\mathcal{E}/\mathcal{T})$ that is consistent with \mathcal{C} .
- A temporal database $\Phi=(\mathcal{T},\mathcal{C})$ supports another temporal database $\Phi'=(\mathcal{T}',\mathcal{C}')$ iff:
 - \mathcal{T} supports \mathcal{T}' and
 - there is an enabling condition $c \in \Theta(\mathcal{T}'/\mathcal{T})$ such that
 - \mathcal{C}' is consistent with \mathcal{C} .
- A temporal database $\Phi=(\mathcal{T},\mathcal{C})$ entails another temporal database $\Phi'=(\mathcal{T}',\mathcal{C}')$ iff:
 - \mathcal{T} supports \mathcal{T}' and
 - there is an enabling condition $c \in \Theta(\mathcal{T}'/\mathcal{T})$ such that
 - \mathcal{C} entails \mathcal{C}' .

Temporal Planning Operators: Example

- $\text{move}(r, l, l') @ [t_b, t_e]$
 - preconditions: $\text{at}(r, l) @ [t_1, t_b]$, $\text{free}(l') @ [t_2, t_e]$
 - effects: $\text{at}(r, \text{path}) @ [t_b, t_e]$, $\text{at}(r, l') @ [t_e, t_3]$, $\text{free}(l) @ [t_4, t_5]$
 - constraints: $t_b < t_4 < t_2$, $\text{adjacent}(l, l')$

Temporal Planning

43

Temporal Planning Operators: Example

- $\text{move}(r, l, l') @ [t_b, t_e]$
 - preconditions: $\text{at}(r, l) @ [t_1, t_b]$, $\text{free}(l') @ [t_2, t_e]$
 - effects: $\text{at}(r, \text{path}) @ [t_b, t_e]$, $\text{at}(r, l') @ [t_e, t_3]$, $\text{free}(l) @ [t_4, t_5]$
 - constraints: $t_b < t_4 < t_2$, $\text{adjacent}(l, l')$

Temporal Planning Operators

- A temporal planning operator o is a tuple $(\text{name}(o), \text{precond}(o), \text{effects}(o), \text{constr}(o))$, where:
 - $\text{name}(o)$ is an expression of the form $a(x_1, \dots, x_k, t_b, t_e)$ such that:
 - a is a unique operator symbol,
 - x_1, \dots, x_k are the object variables appearing in o , and
 - t_b, t_e are temporal variables in o ,
 - $\text{precond}(o)$ and $\text{effects}(o)$ are sets of $tqes$, and
 - $\text{constr}(o)$ is a conjunction of the following constraints:
 - temporal constraints on t_b, t_e and possibly further time points,
 - rigid relations between objects, and
 - binding constraints of the form $x=y$, $x \neq y$, or $x \in D$.

Temporal Planning

44

Temporal Planning Operators

• A temporal planning operator o is a tuple $(\text{name}(o), \text{precond}(o), \text{effects}(o), \text{constr}(o))$, where:

• $\text{name}(o)$ is an expression of the form $a(x_1, \dots, x_k, t_b, t_e)$ such that:

- a is a unique operator symbol,
- x_1, \dots, x_k are the object variables appearing in o , and
- t_b, t_e are temporal variables in o ,

• $\text{precond}(o)$ and $\text{effects}(o)$ are sets of $tqes$, and

• $\text{constr}(o)$ is a conjunction of the following constraints:

- temporal constraints on t_b, t_e and possibly further time points,
- rigid relations between objects, and
- binding constraints of the form $x=y$, $x \neq y$, or $x \in D$.

• note: operators are usually written as in the example in the previous slide

• no negative effects: handled by domain axioms or state-variable representation

Applicability of Temporal Planning Operators

- A temporal planning operator o is applicable to a temporal database $\Phi=(\mathcal{F},\mathcal{C})$ iff:
 - $\text{precond}(o)$ is supported by \mathcal{F} and
 - there is an enabling condition c in $\Theta(\text{precond}(o)/\mathcal{F})$ such that:
 - $\mathcal{C} \cup \text{constr}(o) \cup c$ is consistent.
- The result of applying an applicable action a to Φ is a set of possible temporal databases
 - $\gamma_0(\Phi,a) = \{ (\mathcal{F} \cup \text{effects}(a), \mathcal{C} \cup \text{constr}(a) \cup c) \mid c \in \Theta(\text{precond}(a)/\mathcal{F}) \}$

Temporal Planning

45

Applicability of Temporal Planning Operators

•A temporal planning operator o is applicable to a temporal database $\Phi=(\mathcal{F},\mathcal{C})$ iff:

- $\text{precond}(o)$ is supported by \mathcal{F} and
- there is an enabling condition c in $\Theta(\text{precond}(o)/\mathcal{F})$ such that:
 - $\mathcal{C} \cup \text{constr}(o) \cup c$ is consistent.

•The result of applying an applicable action a to Φ is a set of possible temporal databases

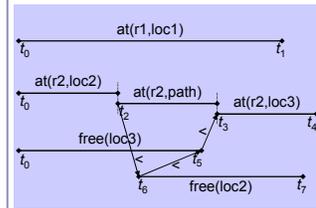

- action: partially instantiated operator
- $\gamma_0(\Phi,a) = \{ (\mathcal{F} \cup \text{effects}(a), \mathcal{C} \cup \text{constr}(a) \cup c) \mid c \in \Theta(\text{precond}(a)/\mathcal{F}) \}$

•provisional definition; see Automated Planning book for complete definition

•result is set: not due to non-determinism but different ways in which a can be inserted

•note: applying an action a does not remove anything from the temporal database

Applicable Operator: Example

- operator: $\text{move}(r,l,l')@[t_b,t_e[$
 - $\text{at}(r1,loc1)@[t_0,t_1[$ supports $\text{at}(r,l)@[t'_1,t_b[$
 - $\text{free}(loc2)@[t_6,t_7[$ supports $\text{free}(l')@[t'_2,t_e[$
 - enabling condition: $\{r=rob1, l=loc1, l'=loc1, t_0 \leq t'_1, t_b \leq t_1, t_6 \leq t'_2, t_e \leq t_7\}$
 - consistent
- $\text{move}(r1,loc1,loc2)$ is applicable

Temporal Planning

46

Applicable Operator: Example

•[figure]

•operator: $\text{move}(r,l,l')@[t_b,t_e[$

•time points with prime are from operator definition

• $\text{at}(r1,loc1)@[t_0,t_1[$ supports $\text{at}(r,l)@[t'_1,t_b[$

• $\text{free}(loc2)@[t_6,t_7[$ supports $\text{free}(l')@[t'_2,t_e[$

•enabling condition: $\{r=rob1, l=loc1, l'=loc1, t_0 \leq t'_1, t_b \leq t_1, t_6 \leq t'_2, t_e \leq t_7\}$

•consistent

• $\text{move}(r1,loc1,loc2)$ is applicable

•other possibility: $\text{move}(r2,loc3,loc2)$

Domain Axioms: Example

- no object can be in two places at the same time:
 $\{at(r,l)@[t_b,t_e[, at(r',l')@[t'_b,t'_e[] \rightarrow$
 $(r \neq r') \vee (l \neq l') \vee (t_e \leq t'_b) \vee (t'_e \leq t_b)$
- every location can be occupied by one robot only:
 $\{at(r,l)@[t_1,t'_1[, free(l')@[t_2,t'_2[] \rightarrow$
 $(l \neq l') \vee (t'_1 \leq t_2) \vee (t'_2 \leq t_1)$

Temporal Planning

47

Domain Axioms: Example

- no object can be in two places at the same time:

$$\{at(r,l)@[t_b,t_e[, at(r',l')@[t'_b,t'_e[] \rightarrow$$
$$(r \neq r') \vee (l \neq l') \vee (t_e \leq t'_b) \vee (t'_e \leq t_b)$$

- every location can be occupied by one robot only:

$$\{at(r,l)@[t_1,t'_1[, free(l')@[t_2,t'_2[] \rightarrow$$
$$(l \neq l') \vee (t'_1 \leq t_2) \vee (t'_2 \leq t_1)$$

Domain Axioms

- A domain axiom α is an expression of the form: $\text{cond}(\alpha) \rightarrow \text{disj}(\alpha)$ where:
 - $\text{cond}(\alpha)$ is a set of *tqes* and
 - $\text{disj}(\alpha)$ is a disjunction of temporal and object constraints.
- A temporal database $\Phi=(\mathcal{T},\emptyset)$ is consistent with α iff:
 - $\text{cond}(\alpha)$ is supported by \mathcal{T} and
 - for every enabling condition $c_1 \in \Theta(\text{cond}(\alpha)/\mathcal{T})$
 - there is at least one disjunct $c_2 \in \text{disj}(\alpha)$ such that
 - $\emptyset \cup c_1 \cup c_2$ is consistent.

Temporal Planning

48

Domain Axioms

•A domain axiom α is an expression of the form: $\text{cond}(\alpha) \rightarrow \text{disj}(\alpha)$ where:

- $\text{cond}(\alpha)$ is a set of *tqes* and
- $\text{disj}(\alpha)$ is a disjunction of temporal and object constraints.

•A temporal database $\Phi=(\mathcal{T},\emptyset)$ is consistent with α iff:

- $\text{cond}(\alpha)$ is supported by \mathcal{T} and
- for every enabling condition $c_1 \in \Theta(\text{cond}(\alpha)/\mathcal{T})$
 - there is at least one disjunct $c_2 \in \text{disj}(\alpha)$ such that
 - $\emptyset \cup c_1 \cup c_2$ is consistent.

Temporal Planning Domains

- A temporal planning domain is a triple $\mathcal{D} = (S_\phi, \theta, X)$ where:
 - S_ϕ is the set of all temporal databases that can be defined with the constraints and the constant, variable, and relation symbols in our representation,
 - θ is the set of temporal planning operators, and
 - X is a set of domain axioms.

Temporal Planning

49

Temporal Planning Domains

- A temporal planning domain is a triple $\mathcal{D} = (S_\phi, \theta, X)$ where:

- S_ϕ is the set of all temporal databases that can be defined with the constraints and the constant, variable, and relation symbols in our representation,
- θ is the set of temporal planning operators, and
- X is a set of domain axioms.

Temporal Planning Problems

- A temporal planning problem in \mathcal{D} is a triple $\mathcal{P} = (\mathcal{D}, \Phi_0, \Phi_g)$ where:
 - $\mathcal{D} = (S_\phi, \theta, X)$ is a temporal planning domain,
 - $\Phi_0 = (\mathcal{F}, \mathcal{C})$ is a database in S_ϕ that satisfies the axioms in X .
 - represents the initial scenario including:
 - initial state of the world
 - predicted evolution independent of planned actions
 - $\Phi_g = (\mathcal{G}, \mathcal{C}_g)$ is a database in S_ϕ where:
 - \mathcal{G} is a set of *tasks* representing the goals of the problem
 - \mathcal{C}_g are object and temporal constraints on variables in \mathcal{G} .

Temporal Planning

50

Temporal Planning Problems

• A temporal planning problem in \mathcal{D} is a triple

$\mathcal{P} = (\mathcal{D}, \Phi_0, \Phi_g)$ where:

- $\mathcal{D} = (S_\phi, \theta, X)$ is a temporal planning domain,
- $\Phi_0 = (\mathcal{F}, \mathcal{C})$ is a database in S_ϕ that satisfies the axioms in X .
 - represents the initial scenario including:
 - initial state of the world
 - predicted evolution independent of planned actions
- $\Phi_g = (\mathcal{G}, \mathcal{C}_g)$ is a database in S_ϕ where:
 - \mathcal{G} is a set of *tasks* representing the goals of the problem
 - \mathcal{C}_g are object and temporal constraints on variables in \mathcal{G} .

Statement of a Planning Problem

- A statement of a planning problem is a tuple $P = (\mathcal{O}, X, \Phi_0, \Phi_g)$ where:
 - is a set of temporal planning operators,
 - is a set of domain axioms,
 - $\Phi_0 = (\mathcal{T}_0, \mathcal{L}_0)$ is a database in S_Φ representing the initial scenario, and
 - $\Phi_g = (\mathcal{G}, \mathcal{L}_g)$ is a database in S_Φ representing the goals of the problem.

Temporal Planning

51

Statement of a Planning Problem

• A statement of a planning problem is a tuple $P = (\mathcal{O}, X, \Phi_0, \Phi_g)$ where:

- is a set of temporal planning operators,
- is a set of domain axioms,
- $\Phi_0 = (\mathcal{T}_0, \mathcal{L}_0)$ is a database in S_Φ representing the initial scenario, and
- $\Phi_g = (\mathcal{G}, \mathcal{L}_g)$ is a database in S_Φ representing the goals of the problem.

Concurrent Actions

- problem: swap locations of two robots
 - only one robot at each location at any time
 - path may hold multiple robots
- move(r1,loc1,loc2): not applicable
- move(r2,loc2,loc1): not applicable
- apply both at the same time: applicable

- temporal planning can handle such concurrent actions

Temporal Planning

52

Concurrent Actions

- **problem: swap locations of two robots**
 - **only one robot at each location at any time**
 - **path may hold multiple robots**
- **move(r1,loc1,loc2): not applicable**
- **move(r2,loc2,loc1): not applicable**
- **apply both at the same time: applicable**
- **temporal planning can handle such concurrent actions**
 - **higher expressiveness!**

Temporal Planning Procedure

```
TPS( $\Omega$ )
  flaws  $\leftarrow$   $\Omega$ .getFlaws()
  if flaws= $\emptyset$  then return  $\Omega$ 
  flaw  $\leftarrow$  flaws.chooseOne()
  resolvers  $\leftarrow$  flaw.getResolvers( $\Omega$ )
  if resolvers= $\emptyset$  then return failure
  resolver  $\leftarrow$  resolvers.selectOne()
   $\Omega'$   $\leftarrow$   $\Omega$ .refine(resolver)
  return TPS( $\Omega'$ )
```

Temporal Planning

53

Temporal Planning Procedure

- TPS(Ω)
- flaws* \leftarrow Ω .getFlaws()
- if *flaws*= \emptyset then return Ω
- flaw* \leftarrow *flaws*.chooseOne()
- resolvers* \leftarrow *flaw*.getResolvers(Ω)
- if *resolvers*= \emptyset then return failure
- resolver* \leftarrow *resolvers*.selectOne()
- Ω' \leftarrow Ω .refine(*resolver*)
- return TPS(Ω')

Structure of Ω

- $\Omega = (\Phi, \mathcal{G}, \mathcal{Z}, \pi)$: current processing stage of the planning problem, where:
 - $\Phi = (\mathcal{T}, \mathcal{O})$: current temporal database, initially Φ_0
 - \mathcal{G} : set of current open goals, initially taken from $\Phi_g = (\mathcal{G}, \mathcal{O}_g)$
 - $\mathcal{Z} = \{C_1, \dots, C_i\}$: set of pending conditions (initially empty):
 - sets of enabling conditions of actions and
 - sets of consistency conditions of axioms,
 - π : set of actions in the current plan, initially empty.

Temporal Planning

54

Structure of Ω

• $\Omega = (\Phi, \mathcal{G}, \mathcal{Z}, \pi)$: current processing stage of the planning problem, where:

- $\Phi = (\mathcal{T}, \mathcal{O})$: current temporal database, initially Φ_0
- \mathcal{G} : set of current open goals, initially taken from $\Phi_g = (\mathcal{G}, \mathcal{O}_g)$
- $\mathcal{Z} = \{C_1, \dots, C_i\}$: set of pending conditions (initially empty):
 - sets of enabling conditions of actions and
 - sets of consistency conditions of axioms,
- π : set of actions in the current plan, initially empty.

Flaw Type: Open Goal
Resolver: Existing tqe

- goal: unsupported tqe e in \mathcal{G}
- assumption:
 - tqe in \mathcal{T} that can support e
- resolver:
 - $\mathcal{K} \leftarrow \mathcal{K} \cup \{\Theta(e/\mathcal{T})\}$
 - $\mathcal{G} \leftarrow \mathcal{G} - \{e\}$

Temporal Planning

 - tqe in \mathcal{T} that can support e
- resolver:
 - $\mathcal{K} \leftarrow \mathcal{K} \cup \{\Theta(e/\mathcal{T})\}$
 - $\mathcal{G} \leftarrow \mathcal{G} - \{e\}$

Flaw Type: Open Goal Resolver: New Action

- goal: unsupported tqe e in \mathcal{G}
- assumption:
 - action a (instance of operator o)
 - has effects(a) that support e and and
 - constr(a) are consistent with \mathcal{C}
- resolver:
 - $\pi \leftarrow \pi \cup \{a\}$
 - $\mathcal{F} \leftarrow \mathcal{F} \cup \text{effects}(a)$
 - $\mathcal{C} \leftarrow \mathcal{C} \cup \text{constr}(a)$
 - $\mathcal{G} \leftarrow (\mathcal{G} - \{e\}) \cup \text{precond}(a)$
 - $\mathcal{Z} \leftarrow \mathcal{Z} \cup \{\Theta(\text{precond}(a)/\Phi)\}$
