

Exercise 1. Sum-product message passing

We here re-consider the factor tree from the lecture on exact inference.

Let all variables be binary, $x_i \in \{0, 1\}$, and the factors be defined as follows:

x_1	ϕ_A	x_2	ϕ_B	x_1	x_2	x_3	ϕ_C	x_3	x_4	ϕ_D	x_3	x_5	ϕ_E	x_5	ϕ_F
0	2	0	4	0	0	0	4	0	0	8	0	0	3	0	1
1	4	1	4	1	0	0	2	1	0	2	1	0	6	1	8
				0	1	0	2	0	1	2	0	1	6		
				1	0	1	6	1	1	6	1	1	3		
				0	1	1	6								
				1	1	1	4								

- (a) Mark the graph with arrows indicating all messages that need to be computed for the computation of $p(x_1)$.

Solution.

- (b) Compute the messages that you have identified.

Assuming that the computation of the messages is scheduled according to a common clock, group the messages together so that all messages in the same group can be computed in parallel during a clock cycle.

Solution. Since the variables are binary, each message can be represented as a two-dimensional vector. We use the convention that the first element of the vector corresponds to the message for $x_i = 0$ and the second element to the message for $x_i = 1$. For example,

$$\boldsymbol{\mu}_{\phi_A \rightarrow x_1} = \begin{pmatrix} 2 \\ 4 \end{pmatrix} \quad (\text{S.1})$$

means that the message $\mu_{\phi_A \rightarrow x_1}(x_1)$ equals 2 for $x_1 = 0$, i.e. $\mu_{\phi_A \rightarrow x_1}(0) = 2$.

The following figure shows a grouping (scheduling) of the computation of the messages.

Clock cycle 1:

$$\boldsymbol{\mu}_{\phi_A \rightarrow x_1} = \begin{pmatrix} 2 \\ 4 \end{pmatrix} \quad \boldsymbol{\mu}_{\phi_B \rightarrow x_2} = \begin{pmatrix} 4 \\ 4 \end{pmatrix} \quad \boldsymbol{\mu}_{x_4 \rightarrow \phi_D} = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \quad \boldsymbol{\mu}_{\phi_F \rightarrow x_5} = \begin{pmatrix} 1 \\ 8 \end{pmatrix} \quad (\text{S.2})$$

Clock cycle 2:

$$\boldsymbol{\mu}_{x_2 \rightarrow \phi_C} = \boldsymbol{\mu}_{\phi_B \rightarrow x_2} = \begin{pmatrix} 4 \\ 4 \end{pmatrix} \quad \boldsymbol{\mu}_{x_5 \rightarrow \phi_E} = \boldsymbol{\mu}_{\phi_F \rightarrow x_5} = \begin{pmatrix} 1 \\ 8 \end{pmatrix} \quad (\text{S.3})$$

Message $\mu_{\phi_D \rightarrow x_3}$ is defined as

$$\mu_{\phi_D \rightarrow x_3}(x_3) = \sum_{x_4} \phi_D(x_3, x_4) \mu_{x_4 \rightarrow \phi_D}(x_4) \quad (\text{S.4})$$

so that

$$\mu_{\phi_D \rightarrow x_3}(0) = \sum_{x_4=0}^1 \phi_D(0, x_4) \mu_{x_4 \rightarrow \phi_D}(x_4) \quad (\text{S.5})$$

$$= \phi_D(0, 0) \mu_{x_4 \rightarrow \phi_D}(0) + \phi_D(0, 1) \mu_{x_4 \rightarrow \phi_D}(1) \quad (\text{S.6})$$

$$= 8 \cdot 1 + 2 \cdot 1 \quad (\text{S.7})$$

$$= 10 \quad (\text{S.8})$$

$$\mu_{\phi_D \rightarrow x_3}(1) = \sum_{x_4=0}^1 \phi_D(1, x_4) \mu_{x_4 \rightarrow \phi_D}(x_4) \quad (\text{S.9})$$

$$= \phi_D(1, 0) \mu_{x_4 \rightarrow \phi_D}(0) + \phi_D(1, 1) \mu_{x_4 \rightarrow \phi_D}(1) \quad (\text{S.10})$$

$$= 2 \cdot 1 + 6 \cdot 1 \quad (\text{S.11})$$

$$= 8 \quad (\text{S.12})$$

and thus

$$\boldsymbol{\mu}_{\phi_D \rightarrow x_3} = \begin{pmatrix} 10 \\ 8 \end{pmatrix}. \quad (\text{S.13})$$

The above computations can be written more compactly in matrix notation. Let $\boldsymbol{\phi}_D$ be the matrix that contains the outputs of $\phi_D(x_3, x_4)$

$$\boldsymbol{\phi}_D = \begin{pmatrix} \phi_D(x_3 = 0, x_4 = 0) & \phi_D(x_3 = 0, x_4 = 1) \\ \phi_D(x_3 = 1, x_4 = 0) & \phi_D(x_3 = 1, x_4 = 1) \end{pmatrix} = \begin{pmatrix} 8 & 2 \\ 2 & 6 \end{pmatrix}. \quad (\text{S.14})$$

We can then write $\boldsymbol{\mu}_{\phi_D \rightarrow x_3}$ in terms of a matrix vector product,

$$\boldsymbol{\mu}_{\phi_D \rightarrow x_3} = \boldsymbol{\phi}_D \boldsymbol{\mu}_{x_4 \rightarrow \phi_D}. \quad (\text{S.15})$$

Clock cycle 3:

Representing the factor ϕ_E as matrix $\boldsymbol{\phi}_E$,

$$\boldsymbol{\phi}_E = \begin{pmatrix} \phi_E(x_3 = 0, x_5 = 0) & \phi_E(x_3 = 0, x_5 = 1) \\ \phi_E(x_3 = 1, x_5 = 0) & \phi_E(x_3 = 1, x_5 = 1) \end{pmatrix} = \begin{pmatrix} 3 & 6 \\ 6 & 3 \end{pmatrix}, \quad (\text{S.16})$$

we can write

$$\mu_{\phi_E \rightarrow x_3}(x_3) = \sum_{x_5} \phi_E(x_3, x_5) \mu_{x_5 \rightarrow \phi_E}(x_5) \quad (\text{S.17})$$

as a matrix vector product,

$$\boldsymbol{\mu}_{\phi_E \rightarrow x_3} = \boldsymbol{\phi}_E \boldsymbol{\mu}_{x_5 \rightarrow \phi_E} \quad (\text{S.18})$$

$$= \begin{pmatrix} 3 & 6 \\ 6 & 3 \end{pmatrix} \begin{pmatrix} 1 \\ 8 \end{pmatrix} \quad (\text{S.19})$$

$$= \begin{pmatrix} 51 \\ 30 \end{pmatrix}. \quad (\text{S.20})$$

Clock cycle 4:

Variable node x_3 has received all incoming messages, and can thus output $\mu_{x_3 \rightarrow \phi_C}$,

$$\mu_{x_3 \rightarrow \phi_C}(x_3) = \mu_{\phi_D \rightarrow x_3}(x_3) \mu_{\phi_E \rightarrow x_3}(x_3). \quad (\text{S.21})$$

Using \odot to denote element-wise multiplication of two vectors, we have

$$\boldsymbol{\mu}_{x_3 \rightarrow \phi_C} = \boldsymbol{\mu}_{\phi_D \rightarrow x_3} \odot \boldsymbol{\mu}_{\phi_E \rightarrow x_3} \quad (\text{S.22})$$

$$= \begin{pmatrix} 10 \\ 8 \end{pmatrix} \odot \begin{pmatrix} 51 \\ 30 \end{pmatrix} \quad (\text{S.23})$$

$$= \begin{pmatrix} 510 \\ 240 \end{pmatrix}. \quad (\text{S.24})$$

Clock cycle 5:

Factor node ϕ_C has received all incoming messages, and can thus output $\mu_{\phi_C \rightarrow x_1}$,

$$\mu_{\phi_C \rightarrow x_1}(x_1) = \sum_{x_2, x_3} \phi_C(x_1, x_2, x_3) \mu_{x_2 \rightarrow \phi_C}(x_2) \mu_{x_3 \rightarrow \phi_C}(x_3). \quad (\text{S.25})$$

Writing out the sum for $x_1 = 0$ and $x_1 = 1$ gives

$$\mu_{\phi_C \rightarrow x_1}(0) = \sum_{x_2, x_3} \phi_C(0, x_2, x_3) \mu_{x_2 \rightarrow \phi_C}(x_2) \mu_{x_3 \rightarrow \phi_C}(x_3) \quad (\text{S.26})$$

$$= \phi_C(0, x_2, x_3) \mu_{x_2 \rightarrow \phi_C}(x_2) \mu_{x_3 \rightarrow \phi_C}(x_3) \Big|_{(x_2, x_3)=(0,0)} + \quad (\text{S.27})$$

$$\phi_C(0, x_2, x_3) \mu_{x_2 \rightarrow \phi_C}(x_2) \mu_{x_3 \rightarrow \phi_C}(x_3) \Big|_{(x_2, x_3)=(1,0)} + \quad (\text{S.28})$$

$$\phi_C(0, x_2, x_3) \mu_{x_2 \rightarrow \phi_C}(x_2) \mu_{x_3 \rightarrow \phi_C}(x_3) \Big|_{(x_2, x_3)=(0,1)} + \quad (\text{S.29})$$

$$\phi_C(0, x_2, x_3) \mu_{x_2 \rightarrow \phi_C}(x_2) \mu_{x_3 \rightarrow \phi_C}(x_3) \Big|_{(x_2, x_3)=(1,1)} \quad (\text{S.30})$$

$$= 4 \cdot 4 \cdot 510 + \quad (\text{S.31})$$

$$2 \cdot 4 \cdot 510 + \quad (\text{S.32})$$

$$2 \cdot 4 \cdot 240 + \quad (\text{S.33})$$

$$6 \cdot 4 \cdot 240 \quad (\text{S.34})$$

$$= 19920 \quad (\text{S.35})$$

$$\mu_{\phi_C \rightarrow x_1}(1) = \sum_{x_2, x_3} \phi_C(1, x_2, x_3) \mu_{x_2 \rightarrow \phi_C}(x_2) \mu_{x_3 \rightarrow \phi_C}(x_3) \quad (\text{S.36})$$

$$= \phi_C(1, x_2, x_3) \mu_{x_2 \rightarrow \phi_C}(x_2) \mu_{x_3 \rightarrow \phi_C}(x_3) \Big|_{(x_2, x_3)=(0,0)} + \quad (\text{S.37})$$

$$\phi_C(1, x_2, x_3) \mu_{x_2 \rightarrow \phi_C}(x_2) \mu_{x_3 \rightarrow \phi_C}(x_3) \Big|_{(x_2, x_3)=(1,0)} + \quad (\text{S.38})$$

$$\phi_C(1, x_2, x_3) \mu_{x_2 \rightarrow \phi_C}(x_2) \mu_{x_3 \rightarrow \phi_C}(x_3) \Big|_{(x_2, x_3)=(0,1)} + \quad (\text{S.39})$$

$$\phi_C(1, x_2, x_3) \mu_{x_2 \rightarrow \phi_C}(x_2) \mu_{x_3 \rightarrow \phi_C}(x_3) \Big|_{(x_2, x_3)=(1,1)} \quad (\text{S.40})$$

$$= 2 \cdot 4 \cdot 510 + \quad (\text{S.41})$$

$$6 \cdot 4 \cdot 510 + \quad (\text{S.42})$$

$$6 \cdot 4 \cdot 240 + \quad (\text{S.43})$$

$$4 \cdot 4 \cdot 240 \quad (\text{S.44})$$

$$= 25920 \quad (\text{S.45})$$

and hence

$$\mu_{\phi_C \rightarrow x_1} = \begin{pmatrix} 19920 \\ 25920 \end{pmatrix} \quad (\text{S.46})$$

After step 5, variable node x_1 has received all incoming messages and the marginal can be computed.

In addition to the messages needed for computation of $p(x_1)$ one can compute *all* messages in the graph in five clock cycles, see Figure 1. This means that *all* marginals, as well as the joints of those variables sharing a factor node, are available after five clock cycles.

(c) What is $p(x_1 = 1)$?

Solution. We compute the marginal $p(x_1)$ as

$$p(x_1) \propto \mu_{\phi_A \rightarrow x_1}(x_1) \mu_{\phi_C \rightarrow x_1}(x_1) \quad (\text{S.47})$$

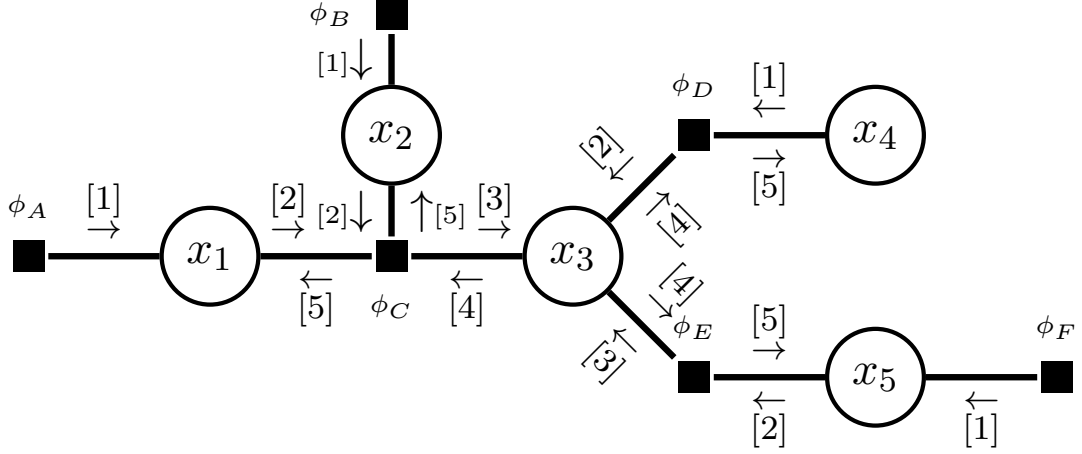

Figure 1: Answer to Exercise 1 Question (b): Computing all messages in five clock cycles. If we also computed the messages toward the leaf factor nodes, we needed six cycles, but they are not necessary for computation of the marginals so they are omitted.

which is in vector notation

$$\begin{pmatrix} p(x_1 = 0) \\ p(x_1 = 1) \end{pmatrix} \propto \mu_{\phi_A \rightarrow x_1} \odot \mu_{\phi_C \rightarrow x_1} \quad (\text{S.48})$$

$$\propto \begin{pmatrix} 2 \\ 4 \end{pmatrix} \odot \begin{pmatrix} 19920 \\ 25920 \end{pmatrix} \quad (\text{S.49})$$

$$\propto \begin{pmatrix} 39840 \\ 103680 \end{pmatrix}. \quad (\text{S.50})$$

Normalisation gives

$$\begin{pmatrix} p(x_1 = 0) \\ p(x_1 = 1) \end{pmatrix} = \frac{1}{39840 + 103680} \begin{pmatrix} 39840 \\ 103680 \end{pmatrix} \quad (\text{S.51})$$

$$= \begin{pmatrix} 0.2776 \\ 0.7224 \end{pmatrix} \quad (\text{S.52})$$

so that $p(x_1 = 1) = 0.7224$.

- (d) Draw the factor graph corresponding to $p(x_1, x_3, x_4, x_5 | x_2 = 1)$ and provide the numerical values for all factors.

Solution. The pmf represented by the original factor graph is

$$p(x_1, \dots, x_5) \propto \phi_A(x_1) \phi_B(x_2) \phi_C(x_1, x_2, x_3) \phi_D(x_3, x_4) \phi_E(x_3, x_5) \phi_F(x_5)$$

The conditional $p(x_1, x_3, x_4, x_5 | x_2 = 1)$ is proportional to $p(x_1, \dots, x_5)$ with x_2 fixed to $x_2 = 1$, i.e.

$$p(x_1, x_3, x_4, x_5 | x_2 = 1) \propto p(x_1, x_2 = 1, x_3, x_4, x_5) \quad (\text{S.53})$$

$$\propto \phi_A(x_1) \phi_B(x_2 = 1) \phi_C(x_1, x_2 = 1, x_3) \phi_D(x_3, x_4) \phi_E(x_3, x_5) \phi_F(x_5) \quad (\text{S.54})$$

$$\propto \phi_A(x_1) \phi_C^{x_2}(x_1, x_3) \phi_D(x_3, x_4) \phi_E(x_3, x_5) \phi_F(x_5) \quad (\text{S.55})$$

where $\phi_C^{x_2}(x_1, x_3) = \phi_C(x_1, x_2 = 1, x_3)$. The numerical values of $\phi_C^{x_2}(x_1, x_3)$ can be read from the table defining $\phi_C(x_1, x_2, x_3)$, extracting those rows where $x_2 = 1$,

x_1	x_2	x_3	ϕ_C		
0	0	0	4		
1	0	0	2		
→ 0	1	0	2		
→ 1	1	0	6	so that	
0	0	1	2		
1	0	1	6		
→ 0	1	1	6		
→ 1	1	1	4		

The factor graph for $p(x_1, x_3, x_4, x_5 | x_2 = 1)$ is shown below. Factor ϕ_B has disappeared since it only depended on x_2 and thus became a constant. Factor ϕ_C is replaced by $\phi_C^{x_2}$ defined above. The remaining factors are the same as in the original factor graph.

- (e) Compute $p(x_1 = 1 | x_2 = 1)$, re-using messages that you have already computed for the evaluation of $p(x_1 = 1)$.

Solution. The message $\mu_{\phi_A \rightarrow x_1}$ is the same as in the original factor graph and $\mu_{x_3 \rightarrow \phi_C^{x_2}} = \mu_{x_3 \rightarrow \phi_C}$. This is because the outgoing message from x_3 corresponds to the effective factor obtained by summing out all variables in the sub-trees attached to x_3 (without the $\phi_C^{x_2}$ branch), and these sub-trees do not depend on x_2 .

The message $\mu_{\phi_C^{x_2} \rightarrow x_1}$ needs to be newly computed. We have

$$\mu_{\phi_C^{x_2} \rightarrow x_1}(x_1) = \sum_{x_3} \phi_C^{x_2}(x_1, x_3) \mu_{x_3 \rightarrow \phi_C^{x_2}} \quad (\text{S.56})$$

or in vector notation

$$\mu_{\phi_C^{x_2} \rightarrow x_1} = \phi_C^{x_2} \mu_{x_3 \rightarrow \phi_C^{x_2}} \quad (\text{S.57})$$

$$= \begin{pmatrix} \phi_C^{x_2}(x_1 = 0, x_3 = 0) & \phi_C^{x_2}(x_1 = 0, x_3 = 1) \\ \phi_C^{x_2}(x_1 = 1, x_3 = 0) & \phi_C^{x_2}(x_1 = 1, x_3 = 1) \end{pmatrix} \mu_{x_3 \rightarrow \phi_C^{x_2}} \quad (\text{S.58})$$

$$= \begin{pmatrix} 2 & 6 \\ 6 & 4 \end{pmatrix} \begin{pmatrix} 510 \\ 240 \end{pmatrix} \quad (\text{S.59})$$

$$= \begin{pmatrix} 2460 \\ 4020 \end{pmatrix} \quad (\text{S.60})$$

We thus obtain for the marginal posterior of x_1 given $x_2 = 1$:

$$\begin{pmatrix} p(x_1 = 0|x_2 = 1) \\ p(x_1 = 1|x_2 = 1) \end{pmatrix} \propto \boldsymbol{\mu}_{\phi_A \rightarrow \mathbf{x}_1} \odot \boldsymbol{\mu}_{\phi_C^{\mathbf{x}_2} \rightarrow \mathbf{x}_1} \quad (\text{S.61})$$

$$\propto \begin{pmatrix} 2 \\ 4 \end{pmatrix} \odot \begin{pmatrix} 2460 \\ 4020 \end{pmatrix} \quad (\text{S.62})$$

$$\propto \begin{pmatrix} 4920 \\ 16080 \end{pmatrix}. \quad (\text{S.63})$$

Normalisation gives

$$\begin{pmatrix} p(x_1 = 0|x_2 = 1) \\ p(x_1 = 1|x_2 = 1) \end{pmatrix} = \begin{pmatrix} 0.2343 \\ 0.7657 \end{pmatrix} \quad (\text{S.64})$$

and thus $p(x_1 = 1|x_2 = 1) = 0.7657$. The posterior probability is slightly larger than the prior probability, $p(x_1 = 1) = 0.7224$.
